_____
Dean of the Graduate College

ACKNOWLEDGMENTS

I would like to express my gratitude to Dr. Lea Ebro, thesis adviser, for her encouragement and assistance in completing my graduate program. Her interest in my research study provided me with the momentum to continue when things appeared endless. My thanks also go to committee members, Dr. William Warde and Dr. Jerrold Leong, for their contributions to the study. Their suggestions and support were appreciated.

To my husband, Brian, and daughter, Julie, thank you for being my biggest advocates and for helping me to accomplish my goal. Without your love, patience, and understanding, this study could not have been completed, I, therefore dedicate this thesis to my family.

CHAPTER I

INTRODUCTION

Anita L. Owen, past president of the American Dietetic Association, stated that the 1980s were years of uncertainty, competition, and marketing (Owen, 1986). Dramatic changes in the regulatory and competitive environment have correlated with a significant drop in hospital patient days. The adoption of diagnosis-related group (DRG) payment plan by the government and the shift toward outpatient treatment areas have also resulted in reduced revenue for hospitals. Once hospital administrators had asked "what is marketing" and "why do we need marketing;" now, many hospitals have a marketing department. These marketing departments are being pressured to develop strategic plans to produce a competitive advantage that will improve the hospital's financial situation (Kizilbash & Wagle, 1986).

Hospital dietary departments, which have traditionally provided patient meals, nutritional care, and counseling, are increasing their marketing efforts to include revenue producing operations. To be effective in the 1990s, marketing of foodservices must shift from a "provider" to a "consumer" orientation (Parks & Moody, 1986). The foodservice director provides for consumer wants; and the consumer must perceive the value of these products or services and be willing to purchase them. Changing to the product market segmentation practices will increase the revenue needed to offset the government's cost containment measures.

1

Foodservice marketing research has been conducted in Texas by Pickens and Shanklin (1985), and in Indiana by Somers (1987). The Texas study identified the state of the art relative to the use of marketing techniques within hospital foodservice departments throughout the United States. This study was to determine whether any relationships existed between the use of marketing techniques and selected demographic characteristics of foodservice administrators and/or operations. Somers expanded on this study to include the perceived importance of marketing by hospital foodservice administrators.

The present study was designed to determine the current foodservice marketing techniques used by Oklahoma hospitals and to determine the current factors that influence increased marketing. It is hoped that the more timely information revealed will encourage foodservice directors to develop a marketing plan that will maximize their business opportunities.

Purpose and Objectives

The purpose of this study is to determine the relationship between the perceived value of marketing by hospital foodservice directors and the application of marketing techniques within selected operations of their department.

Specific objectives included are:

1. Analyze marketing techniques used in hospital foodservice departments. The following areas will be evaluated in relation to marketing techniques used by the foodservice director:

    a. In-house patients

    b. Hospital employees

     c. Hospital visitors

     d. The community

2. Analyze the perceived importance of marketing by foodservice directors. The following marketing techniques will be examined:

     a. Marketing plan

     b. New product development

     c. Mass marketing

     d. Target market

     e. Market niche

     f. Product diversification

     g. Discounting

     h. Merchandising

     i. Advertising

     j. Sales promotions

     k. Public relations

     l. Feedback

     m. Reputation

     n. Internal marketing

3. Determine the importance of marketing based on predetermined variables of foodservice directors and hospitals.

     Respondent Variables

     a. Age

     b. Sex

     c. Years of experience

     d. Highest level of education

     e. Professional affiliations

     f. Current position

g. Employment status

h. Number of hours spent in marketing

Institutional Variables

a. Management of the foodservice department

b. Hospital classification:

Not-for-profit vs. for-profit

Corporate owned

Government operated (federal)

Government operated (city, county)

Owned and managed by a hospital corporation

Religious affiliation

c. Number of beds in facility

d. Average number of meals served daily

e. Population of the city where hospital is located

f. Existence of a hospital marketing department

Hypotheses

H1: The characteristics of the respondents (age, sex, years of experience, level of education, professional affiliations, current position, employment status and number of hours spent in marketing) will have no effect on the marketing techniques utilized by hospitals located in Oklahoma. Marketing techniques were studied for:

a. In-house patients

b. Hospital employees

c. Community

d. Hospital visitors

H2: The characteristics of the institution (management of food-service department, hospital classification, number of beds, average number of meals served daily, population of the city, and existence of a hospital marketing department) will have no effect on the marketing techniques used by hospitals in Oklahoma. The marketing techniques examined were the same as stated in Hypotheses One.

H3: The characteristics of the respondents (age, sex, years of experience, level of education, professional affiliations, current position, employment status, and number of hours spent in marketing will have no effect on the perceived importance of marketing techniques. Specific techniques examined were:

    a. Marketing plan

    b. New product development

    c. Mass marketing

    d. Target market

    e. Market niche

    f. Product diversification

    g. Discounting

    h. Merchandising

    i. Advertising

    j. Sales promotions

    k. Public relations

    l. Feedback

    m. Reputation

    n. Internal marketing

H4: Institutional characteristics (management of foodservice department, hospital classification, number of beds, average number of

meals served daily, population of the city, and existence of a hospital marketing department) will have no effect on the foodservice director's perceived importance of marketing techniques. Specific techniques examined were the same as those stated in Hypothesis Three.

Limitations and Assumptions

This study was limited to Oklahoma hospitals listed in the 1990 edition of the American Hospital Association Guide to the Health Care Field. A questionnaire was mailed to foodservice directors of all 137 hospitals in Oklahoma. Only 47 hospitals were listed as having over 100 bed capacity. However, it was assumed that the characteristics of the sample selected were representative of other hospitals in the United States.

The questionnaire was designed to identify current marketing techniques used by hospital foodservice departments; and to provide characteristics of the foodservice directors and the institutions. It was assumed that the questionnaire was completed without bias.

Definitions

For the purpose of this study the following terms are defined so that the researcher's intent is understood specifically.

Advertising: Any paid, persuasive message used to call public attention to a service or product to arouse a desire to buy or patronize (Zikmund & D'Amico, 1989).

Bottom-line Profits: Net revenue or profit (Ross Laboratories, 1990).

Community at Large: Residents of the city or town in which the hospital facility is located.

Competitive Edge: An advantage over others in business, gained through use of business strategies, market research, expert management, new product development, or other sound business techniques (Helm & Rose, 1986).

Corporate Owned Hospital: A non-profit agency owned under the corporate laws of the state (Riggs, 1991).

Diagnosis Related Groups (DRGs): Medical diagnoses on which federal reimbursement is based. Health care facilities are reimbursed per diagnosis and per historical costs incurred in various geographical regions in the United States. The facility receives no more than a predetermined amount (Ross Laboratories, 1990).

Dietitian Support for Home Health Care: The provision of food or clinical services to patients needing respite care.

Discounting: The process of reducing the price of goods or services to a select group of users.

Downsizing: Reducing operation to a lower level of production. For instance, downsizing a foodservice operation would mean serving fewer meals. Usually implies a reduction in employment force, or layoffs (Helm & Rose, 1986).

Elegant In-room Dining: The formal presentation of meals to provide a non-institutional atmosphere to in-house patients and their guests at an additional charge.

Fast Foods: Non rotating menu selections, such as sandwiches and French fries, that offer quick service.

Feedback: The communication of an individual's reaction back to the source of the message. The receiver becomes the source of the feedback information and the original sender becomes the receiver of the feedback (Zikmund & D'Amico, 1989).

Foodservice Administrator: Individuals employed by a health care institution whose primary responsibility is to manage the administrative functions of the foodservice department.

For-Profit: A classification for a business by the United States Internal Revenue Service that does not allow a tax exempt status.

Government Operated (City, County) Hospital: A city or county, non-profit agency operated under the laws of that specific political entity (Riggs, 1991).

Government Operated (Federal) Hospital: A federal, non-profit agency operated under the laws of that specific political entity (Riggs, 1991).

Gourmet Meals: Specialty meals that are not offered on the rotating cycle menu that are offered for an additional fee.

Gross National Product (GNP): The measure of value of all the goods and services produced in a nation (Zikmund and D'Amico, 1989).

Hospital Employee: Individuals that are hired by the hospital to provide services to patients, other hospital employees, visitors, and the community at large.

Hospital Owned and Managed by a Corporation: A private, profit agency not exempt from federal income tax, owned by a multiple hospital system (Riggs, 1991).

In-House Patient: Individuals who have been hospitalized for medical care. Also referred to as in-patients.

Internal Marketing: A managerial philosophy and a set of activities which view employees as internal customers and jobs as internal products, and then endeavors to offer internal products to satisfy the needs and wants of these internal customers, while at the same time addressing the objectives of the organization (Berry, 1984).

Market: Potential customers for a product (Helm & Rose, 1986).

Marketing: The activities involved in developing product, price, distribution, and promotional mixes that meet and satisfy the needs of customers (Zikmund & D'Amico, 1989).

Marketing Mix: The specific combination of interrelated and inter-dependent marketing activities engaged in by an organization. The basic elements of the marketing mix are product, price, distribution, and promotion (Zikmund & D'Amico, 1989).

Market Niche: The particular area of service or the particular product suited to the specific clients to be reached. The underlying philosophy is that you cannot be all things to all people, so you must find the spot that fits your objectives and goals and meets a particular unmet need. Market niching is the opposite of a mass marketing or market aggregation strategy where one attempts to market the same product or service to everyone (American Dietetic Association, 1987).

Market Share: A general measure of the percentage of all potential customers for a particular product or service that one competitor holds or hopes to capture (Helm & Rose, 1986).

Marketing Technique: The product or service offered in the marketplace. Also referred to as marketing strategies.

Mass Marketing: Attempting to market the same product or service to everyone.

Merchandising: Promoting the sale of a product through presentation.

New Product Development: Generating and introducing new products to the market place.

<u>Not-For-Profit</u>: A classification for a business by the United States Internal Revenue Service that allows special tax considerations (Ross Laboratories, 1990).

<u>Nutritional Counseling</u>: A revenue producing clinical service that provides clients with nutritional information and advice.

<u>Product Diversification</u>: The strategy of marketing new products to new sets of customers (Zikmund & D'Amico, 1989).

<u>Profit</u>: Return on investment in a business, over and above all costs including salaries and expenses (Helm & Rise, 1986).

<u>Public Relations</u>: The unsigned and unpaid activities involved in actively seeking to promote favorable relationship with the in-house patients, hospital employees, the community at large, and hospital visitors (Zikmund & D'Amico, 1989).

<u>Reputation</u>: Terminology used to express how the customer views the products or services provided by the foodservice department.

<u>Revenue</u>: Monies received for services incurred for providing a service, including private patient payment and third party (insurance company) payment (Ross, 1990).

<u>Sales Promotion</u>: The promotional activities, other than advertising, personal selling, and publicity, that stimulate consumer purchases and dealer effectiveness. Typically, a temporary offer of a reward to customers or dealers is made (Zikmund & D'Amico, 1989).

<u>Service</u>: An intangible product -- one that cannot be seen or experienced before it is delivered to the customer (Helm & Rose, 1986).

Strategic Marketing Plan: Guidelines for the marketers to follow setting the broad directions for marketing efforts involving the marketing mix, which are consistent with long range corporate strategies, goals and objectives (American Dietetic Association, 1987).

Take-Home Meals: Meals that are prepared by hospital foodservice employees that are sold to patients to meet their nutritional needs after discharge from the hospital.

Take-Out Meals: Food is sold to be eaten away from the point-of-sale.

Target Market: A particular market or segment of a market toward which an organization directs its marketing plan (Zikmund and D'Amico, 1989).

Theme Menus: A meal offering menu selections that relate to a particular subject or topic, i.e., Italian Cuisine, Spring Fling, Halloween.

Twenty-Four Hour Room Service: Meals or individual food items served during non-service times by the foodservice department for a fee.

Vending: The process of selling food and beverages through automated dispensing machines.

Visitors: Individuals, who are not classified as hospital employees or patients, and who are in the hospital for a short amount of time.

Weight Reduction Programs: A revenue producing clinical service that provides a nutritional plan for individuals desiring to lose weight.

CHAPTER II

REVIEW OF LITERATURE

Introduction

Hospital foodservice directors have experienced a reduction in
staffing, budgets, and services in the past decade as a result of the
diagnostic-related group payment plan. Allen Caudle has predicted that
these changes in healthcare foodservice are just the "training grounds"
for this decade (Boss, 1990). Top economic and financial experts have
made the following healthcare predictions for the 1990s (Solovy, 1989):

1. Health care will consume an increasing portion of the nations
income as measured by the gross national product (GNP).

2. Inflation in the goods and services purchased by hospitals
will continue to increase.

3. Labor costs inflation will be at 6.8% in 1990 and 6.0% in 1995.

4. Hospitals will face tighter financial constraints as operating
margins fall.

5. Average length of stay will not change.

6. Percent of occupancy will increase only 3.4% by 1995.

The prediction that the 1991 real growth of hospital foodservice
is to be at 0.0% with a market share of only 4.4% has hospital food-
service administrators facing a challenge that will lead them to new
sources of sales and profits (Stephenson, 1991). Hospital dietary
departments have traditionally provided patients with meals, nutritional

care and counseling. Foodservice magazines are reporting creative
marketing techniques to in-patients (Long, 1986). These include
restaurant-style menus, gourmet meals, room service, guest trays to
patient visitors, and special meals to celebrate the birth of a child.
Some hospitals offer wine with their gourmet meals. Somers (1987)
noted that the use of gourmet menu selections, suite service with
waiters, and fruit baskets were perceived as important techniques used
by foodservice directors in Indiana. Other techniques more widely
utilized were special holiday meals, birthday cakes, and congratulation
dinners for new parents.

There has been little change in the hospital's occupancy rate and
the trend is now focusing on the downsizing of foodservice units. The
healthcare industry has become more market oriented by directing their
attention toward the public and outpatient populations to build sales
and create new revenue. By identifying specific target groups, health
care is beginning to copy the product market segmentation practices
(Grant, 1987). This will allow foodservice profit centers to support
themselves during the dramatically changing state of healthcare.

There has been very limited research reported on the marketing of
foodservices in the healthcare industry. The researcher reviewed
selected articles that focused on marketing from research journals as
well as trade journals to provide information on current marketing tech-
niques used by hospital foodservice departments.

Marketing Techniques to the Elderly

One of the fastest growing markets is senior care and hospitals
nationwide are targeting this population. It is estimated that

individuals over the age of 55 will account for nearly 20 percent of the population and 70 percent of the nation's wealth by the year 1995 (Winston, 1986). The trend has been to provide services that permit older citizens to live as independently as possible, however, people live longer and are not necessarily "a group of gray-headed, sweater-wearing, rocking chair citizens who start their day with Ovaltine and finish it off with a glass of warm milk" (Sampson, 1990, p. 50). This market can be divided into groups; the young-old who are 65 to 74 years of age and the old-old who are over 85 years old (Beasley, 1987). This segment of the population is still considered in its infancy and seniors are achieving life-styles that leave the marketplace open to foodservice directors that are venturesome. Ideal programs increase revenue while they combine wellness and prevention services with clinical services. Skagit Valley Hospital in Mount Vernon, Washington offers cholesterol testing and special clinics to their Golden Care Club ("For Healthier Choices," 1989). Members also receive 15 percent discounts on meals which are offered during the slow periods of the day. A Senior Sunday Brunch is also offered to keep these customers coming back.

Hospitals have offered programs such as Meals on Wheels that deliver meals to people unable to leave their homes and congregate meal programs that are group feeding sites. There are approximately 400 million such meals served each year and this number is increasing by 10 percent to 12 percent each year (Schechter, 1990). This increase has been accelerated by the growing number of healthcare treatments that require early discharge from the hospital or perhaps are offered only on an out-patient basis. These programs operate with a large number of

volunteers and may be subsidized by the United States Department of Agriculture (USDA) commodity program. Clients who can not pay the full price of the meal are assisted by United Way Organizations, local aging programs, and private contributions. While it is difficult to develop nutritious yet cost effective menus for these programs, many hospitals have the skilled personnel that allows them to market their foodservices to these programs.

Marketing of Cafeteria Services

While hospital employees account for approximately 65 percent of the meals served in the health-care facility (Erickson, 1990), it isn't enough to simply make food available to employees. The food must be appealing and the cafeteria must be operated as a business. The first goal of any business is to provide for the wants and desires of the customer. The foodservice director must continually look for ways to entice employees and then make the food services interesting. Institutions have been promoting gourmet foods, guest chefs, specialty bars and delicatessens, carving stations, "theme" and ethnic menus, contests, nutrition education, nutritious cuisine, and modified diets to promote cafeteria services. Many hospitals offer discounted meals to employees and senior citizens.

Gourmet dining is one way to inspire both patient and employee meal innovations. While some hospitals employ chefs, one popular way to provide gourmet dining is to invite guest chefs from favorite area restaurants to prepare cafeteria meals. Humana Hospital-Medical City Dallas invited a guest chef for a week of cooking, learning and sharing culinary skills (Blake, 1988). This benefited not only the cafeteria

patrons, but foodservice staff and in-house patients as well. Check averages also tended to increase when a guest chef program is implemented.

Hospitals that are interested in upgrading their cafeteria foodservices have offered carving service along with upscale menus. These menus may include theme menus such as those offered by Georgia Baptist Hospital in Atlanta, Georgia ("Georgia Baptist," 1989). Theme days were used to boost the morale of employees and visitors and, at the same time, generate revenue. Some of the theme days offered by Gerogia Baptist Hospital were "Mayberry Day," "Beach Day," "Hearts and Flowers Day," and a "Fifties Party." Ethnic and regional dishes, such as Chinese cuisine or Cajun food, are also popular in hospital cafeterias.

Specialty bars, such as potato, salad, soup, taco, sandwich, deli, and dessert, are extremely popular in hospital cafeterias. When sold by the ounce, specialty bars have become profit centers. One foodservice director reported a 15 percent increase in cafeteria sales because they had attracted customers that would have otherwise gone to a nearby fast food restaurant ("Make-Your-Own," 1989). Sandwich bars also can be labor-cost effective if the foodservice staff had previously been preparing sandwiches. By-the-ounce gives customers the satisfaction of designing their own meals and receiving quick service.

A "Make Your Own Soup" bar was reported in the Market-Link Newsletter ("Make Your Own Soup," 1991). The soup bar provided chicken or beef broth and allowed the customer to add a variety of food items. Some of the food items included vegetables such as peas, corn, carrots, celery, onions, green beans, broccoli; starches such as noodles, lentils, potatoes, or rice; and other food items such as bacon pieces; grated

cheese; and croutons. The soup was served with a variety of crackers and loaf of slice-it-yourself bread. Foodservice directors could be very creative in the marketing of a soup bar.

Nutrition education may be marketed to cafeteria patrons by offering them healthful choices or by making them aware of the nutritional content of the menu items. Lutheran Hospital in LaCrosse, Wisconsin, has "Tattle Tale" cards to inform employees how much each item counts against their daily nutrient requirements (Mielke, 1989) and McLean Hospital in Belmont, Massachusetts, has implemented a "100 Points of Light" program to inform patients and staff how to make healthy choices in eating ("For Healthier Choices," 1990).

Somers (1987) reported that the cafeteria was the number one marketing technique utilized by hospital foodservice departments to employees (97%) and visitors (90%). A study by Pickens and Shanklin (1985) also indicated this marketing technique was utilized to employees (93%) and hospital visitors (83%). Neither of these studies indicated that the cafeteria was marketed to the community at large. As hospital foodservice directors are exploring new sources of revenue, it would appear timely to market cafeteria services to the community at large.

Marketing of Take-Out Services

As more women have entered the work force, convenience has become more of a factor and it is projected that by the year 2001, over 50 percent of all meals will come from a non-traditional source such as hospitals (Stanton & McNutt, 1991). Take-out foodservice has consistently been a revenue producer (Lydecker, 1988), and in hospital

foodservice it can be as varied as the target markets. Identifying those markets and which products they will need or desire is essential and is considered the first step. Patients, hospital employees, patients being discharged, family and guest of patients, office staff, and working mothers with young children are only a few of the potential customers.

While take-out can be used as a solution to limited cafeteria seating or to provide the late-shift employees with meals, hospital food-service must attract other individuals who consider them as potential consumers for take-out food. The take-out market requires a commitment of providing quality food, keeping service standards high, and continuous promoting of the business. Hospitals may offer a complete nutritious meal served from the cafeteria or it could limit the take-out menu to standard items such as sandwiches, salads, or grilled items. It is interesting to note that the public considers the full-service segment for take-out food more nutritional and of better quality than fast-food take-out (Lydecker, 1988).

Creative foodservice managers use promotional strategies that can take many different forms and approaches to advertise quality products. The "Family Meals to Go" program at Kadlec Medical Center has proven to be a great way to capitalize on this service. Using appropriate containers, customers order the number of servings needed to feed their family ("Take-out," 1991).

The elderly, and even singles or people with empty nests, have been taking advantage of Gourmet 500's helpful lunches and dinners. Gourmet 500 is a commercial company that offers meals that are low in sodium, fat, cholesterol and calories. Its customers purchase a 28-day supply

of meals that they can receive over a four-month period and for which they receive a 20 percent discount. Meals are delivered three times a week (Gindin, 1988). Hospitals have looked closely at this type of take-out service and have decided to enter this market. "Just What the Doctor Ordered" (Powills, 1987) and "Nutritious Cuisine" (Long, 1989) are patient after-care feeding programs that are designed to provide the proper diet that is essential to the patient's recovery after hospitalization. Packages of frozen meals which include an entree, vegetable, starch, soup, and dessert, may be purchased upon discharge. Nutritional counseling services may be marketed with these programs as well.

The Marketing of Vending

Vending machines, one of the original forms of self-service, have been around a long time and were used for such products as candy, soft drinks, and cigarettes. While most hospitals do not consider operating their cafeterias 24-hours a day economically feasible, they have discovered the great revenue potential that vending offers after foodservice personnel have gone home. Vending operators have rated hospitals (56%) second only to factories (84%) as a "best" vending site ("Sales Shifting," 1990). Vending operations in hospitals have tra- ditionally been operated by a commercial vending operator on a contract basis and foodservice would earn approximately seven to ten percent of the profits. Hospitals have now discovered what commercial vending operators knew all along, that self-operated vending will double or possibly triple these profits ("The Ins & Outs," 1988).

Modern vending machines can sell any product, particularly food with considerable less labor cost than that associated with manual sales. Cold beverages, baked snacks, hot beverages, salted snacks, chocolate candy, gum and hard candy are the most popular food items vended. More healthy items such as oat bran cookies, fruit and fruit juices, and low cholesterol products are now being vended.

One creative foodservice director in a Southern California hospital had a videocassette vending machine installed by a video machine contractor to generate additional revenue ("Video Machine," 1988). The hospital receives 10 percent of the sales from tapes that rented for $2.00 to $2.99 per day. Although expensive, the customers like the convenience.

Foodservice directors who elect to enter the vending arena can tailor the vending program to the needs of its employees and the institution. There are nine types of vending machines that are used by vending operators. They include: hot beverage; window-front merchandiser; candy, cookies, and crackers; cup cold beverage; canned or bottled cold beverage; all-purpose food; canned juice and milk; pastry; and ice cream (Kaud, Miller & Underwood, 1982). A new line of high tech vending machines that have a built in bean grinder offers a cup of fresh-brewed coffee, microwave dinners that do not require refrigeration, and hot French fry machines are entering the market. New downsized, compact machines have also been introduced that would better accommodate smaller hospitals ("Take-out on the Go," 1991). Appealing to some foodservice directors is a new payment option whereby charge cards with a bar code are scanned by the vending machine and charged to an individual or a department (Beasley, 1990). To enhance

vending services as well as take-out, it has been predicted that 25 per-
cent of the new cars sold will be equipped with microwaves (Stanton &
McNutt, 1991).

Because vending is taking the product to the customer, marketing
of vending services requires that they be placed in areas of high
volume and high customer traffic areas. Primary locations are lobbies,
emergency waiting rooms, employee break areas, and traffic patterns
that lead to parking areas. Another consideration for vending is that
tight controls must be enforced for inventory management, food handling,
and accounting for a vending operation to be successful (Beasley,
1990).

<center>Summary</center>

It appears inevitable that health care costs will continue to
increase, and while we must continue to control costs, the foodservice
director will have opportunities to market the foodservice department.
Foodservice directors that are revenue driven are constantly searching
for new sources, new approaches, and new ways to market their depart-
ments. Literature has been very limited until late 1989, but journals
now abound with information regarding the marketing of foodservices.
As additional marketing information is provided, it is imperative that
foodservice directors evaluate their marketing techniques and integrate
them into a strategic marketing plan for their department.

CHAPTER III

METHODOLOGY

The purpose of this study was to assess the marketing techniques used by hospital foodservice departments in Oklahoma and to determine if an association exists between specific characteristics of the respondents and the institutions with the marketing techniques. It is anticipated that this study will identify the perceived importance of specific marketing techniques that may be utilized by the administrators of the foodservice department. This chapter includes the research design; description of the population to be studied; data collection, including instrumentation and procedure; and data analysis.

Research Design

The research design used in this study is a status quo survey in the form of a mailed questionnaire. The purpose of this status quo survey is to identify the specific marketing techniques used by hospital foodservice departments and to collect information regarding attitudes of the respondents concerning specific marketing techniques. The study will not attempt to manipulate the variables, but to examine marketing as it exists in the hospital foodservice departments in Oklahoma.

The dependent variables of this study were the marketing techniques used to market foodservice to in-house patients, hospital

22

employees, the community at large, and hospital visitors. To determine the foodservice director's perceived importance of marketing techniques, 14 specific dependent variables were used: marketing plan, new product development, mass marketing, target market, market niche, product diversification, discounting, merchandising, advertising, sales promotions, public relations, feedback, reputation, and internal marketing.

The independent variables were the characteristics of the respondents and the characteristics of the institutions. Specific characteristics of the respondents were age, sex, years of experience, level of education, professional affiliation, current position, employment status, and number of hours spent in marketing the foodservice department. Management of the foodservice department, hospital classification, number of beds, average number of meals served daily, population of the city, existence of a hospital marketing department and the number of hours spent marketing the foodservice department were specific characteristics of the institutions.

<div align="center">Population and Sample</div>

The sample, which was the same as the population, consisted of foodservice administrators employed in 137 hospitals in the state of Oklahoma listed in the American Hospital Association Guide to the Health Care Field (1990). This directory includes hospitals registered by the American Hospital Association (AHA) and the American Osteopathic Hospital Association (AOHA). While this directory indicates the hospitals that are accredited by the Joint Commission on Accreditation of Healthcare Organizations (JCAHO), not all hospitals in Oklahoma were listed as having this designation.

Data Collection

Instrumentation

The research instrument (Appendix A) was adapted from the research instrument used by Somers (1987) and was divided into three sections. Section I was divided into four sections and designed to determine the marketing techniques used to market hospital foodservice to in-house patients, visitors, hospital employees, and the community at large. The survey participants were asked to indicate which techniques were currently being used in the foodservice department. Respondents were also able to add marketing techniques that were not included in the lists. Section II was designed to measure the respondents perceived importance of specific marketing techniques. On a scale of one to five, with one being least important and five being most important, the respondents were asked to rate each marketing technique according to importance in the marketing process. Section III was to provide general demographic information regarding the foodservice directors and the hospitals in which they were employed.

Procedure

The questionnaires with two cover letters (Appendix A) were mailed first class on September 15, 1990, to the 137 hospital administrators employed in Oklahoma hospitals listed in the American Hospital Association Guide to the Health Care Field (1990). The first cover letter was a letter from Mr. Paul Dougherty, Administrator at Stillwater Medical Center, to the hospital administrators asking them to refer the survey to the hospital foodservice director. The second cover letter, from

the researcher and the major adviser, instructed the foodservice
director to complete the questionnaire and return it not later than
October 1, 1990. An addressed envelope with first class postage
affixed was included for the respondents to return the completed
surveys. A total of 74 usable surveys (51.7%) were returned, hence
no follow-up letter or post cards were mailed.

Data Analysis

The responses to the questionnaire were tabulated and coded for
analysis. The responses which indicated that a marketing technique was
currently being used were coded with a "1" for yes and a "0" for not
being utilized. In Section II, the actual rating (1-5) was recorded.
A no response was recorded with a "0." Section III provided demo-
graphic data about the respondents and the institutions. The responses
were coded as indicated by the survey participant. The data were
evaluated using the Statistical Analysis System (SAS) (Helwig & Council,
1979). Chi-square analyses was the standard statistical procedure used.
The level of significance was established at $p \leq .05$.

CHAPTER IV

RESULTS AND DISCUSSION

Marketing of the foodservices in hospitals is no longer considered optional or for in-house patients only by the hospital administrators. Foodservice directors are now revenue driven and are being asked to contribute profits to the bottom line of hospital financial statements. The purpose of this study was to assess the current status of marketing in hospital foodservice departments as related to the current marketing techniques used for in-house patients, hospital employees, the community at large, and hospital visitors and to determine the perceived importance of specified marketing techniques.

A six page questionnaire, as described in Chapter III, was mailed to 137 administrators of hospitals located in Oklahoma. The names of these hospitals were obtained from the 1990 edition of the American Hospital Association Guide to the Health Care Field. The administrators were asked to have the foodservice director or supervisor complete and return the research instrument. Seventy-nine (58%) completed question-naires were returned and data from 52% of the responses were analyzed (N = 71). Three hospitals reported that foodservices were either not available or not marketed and three questionnaires were returned after the data were analyzed.

26

Characteristics of the Respondents

To determine the characteristics of the survey participants, respondents were asked to provide general demographic data. Information requested consisted of age, sex, years of experience, level of education, professional affiliation, current position, employment status, and number of hours spent in marketing.

Age and Sex

Respondents were asked to select an age category rather than to give precise ages, however, for analysis purposes the respondents were divided into two categories, those younger than 40 and those 40 and older. Thirty-seven percent (N = 26) listed their age as less than 40, while 63% were over 40 years old (N = 45). Of the 71 respondents, 77.5% were women (N = 5) and 22.5% were men (N = 16) (Table I).

Total Years Experience

The respondents were asked to indicate the total years of work experience. Twenty-eight percent (N = 20) reported having less than 10 years years experience in the field, while over 70% of the respondents indicated greater than 10 years experience. Four respondents had worked in foodservice for more than 30 years and only two had less than one year of experience (Table I).

Education

Forty-six of the respondents (64.8%) had a bachelor's degree and higher, while 22.5% reported a Vocational-Technical degree or an Associate Degree. There were nine respondents that indicated they had

[c] Multiple answers were allowed.

a high school diploma and only one participant did not have a degree
at all (Table I).

Professional Affiliation

Foodservice directors were asked to indicate their professional
affiliation(s). Respondents were to check all or any of the four
affiliations listed. They were also allowed to list other affiliations
in the "Other" category. Thirty-four respondents (47.9%) were members
of the American Dietetic Association (ADA). Thirty-three of the ADA
members were registered and one had applied for registration. The
researcher, therefore, considered all ADA members as registered members
of ADA. Dietary Managers Association members accounted for 35% of the
respondents (N = 25). Twenty-two respondents were members of the
American Society for Hospital Foodservice Administrators (ASHFSA),
while only six were members of the National Restaurant Association.
Two respondents listed the Institute of Food Technologists in the
"Other" category (Table I).

Current Position

The respondents were asked to list their current position.
Sixty-two percent of the respondents listed their current position as
foodservice director or department head (N = 44). Five respondents
were clinical dietitians and 17 of the respondents were supervisors
or dietary managers. It is interesting to note that three of the 71
respondents were hospital administrators which possibly indicated that
the hospital did not have a dietary manager. Only two of the respond-
ends did not specify a current position (Table I).

Employment Status

Respondents were asked to indicate their employment status, with full-time being employed 35 or more hours per week and part-time as working less than 35 hours per week. Almost all of the participants (96%) indicated working full-time, while only three worked part-time (Table I).

Hours Marketing

Respondents were to indicate on the questionnaire the number of hours they spend in marketing the foodservice department each week. Twelve participants did not market the foodservice department and seven responded that they marketed the department but did not specify the amount of time. Ten respondents spent less than one hour, 32.4% (N = 23) spent from one to two hours, and 14.1% (N = 10) spent from two to three hours marketing the foodservice department. Nine respondents indicated that they engaged in marketing the foodservice department more than three hours per week (Table I).

Characteristics of the Institutions

To determine the characteristics of the hospitals, respondents were asked to provide demographic information about the institutions in which they were employed. This information included management of the foodservice department, hospital classification, number of beds, average number of meals served daily, population of the city, existence of a hospital marketing department and the number of hours the hospital marketing department spends marketing foodservice.

Management and Classification of the
Foodservice Department

Of the 71 institutions participating in the study, 95.8% (N = 61) reported that the foodservice department was managed by the hospital. Ten hospitals were managed by a contract foodservice company (Table II).

Respondents were asked to specify if their hospital was for profit or not for profit and if they were corporate owned, federal government operated, city or county government operated, owned and managed by a hospital corporation, or if they were religious affiliated. Respondents were permitted to list other information regarding classification of the hospital. More than one answer was allowed. Forty-five of the hospitals were classified as not for profit, while 11 were for profit. Not all hospitals designated between these two classifications. Government hospitals, that are generally considered not for profit, were divided into federally operated and those that were city or county operated. Four hospitals were owned and/or managed by a hospital corporation and five were religious affiliated (Table II).

Number of Beds, Average Number of Meals
and Population of City

Because Oklahoma has numerous small rural communities, it was not surprising to observe that 43 (61%) of the 71 respondent hospitals were less than 100 beds. Twelve respondents indicated that their hospitals were between 101 and 200 beds and seven hospitals were between 201 and 300 beds. Six hospitals were larger than 500 beds capacity (Table II).

Twenty-five percent (N = 18) of the hospitals served an average of less than 100 meals per day and 10 (14%) served between 100 and 199

[c]Multiple answers were allowed.

meals per day. Eleven hospitals indicated that they served more than 1000 meals per day (Table II).

Thirty hospitals were located in towns with less than 10,000 residents and 19 were located in cities with a population between 10,000 and 49,999. Eight hospitals were located in cities of greater than 750,000 residents (Table II).

Existence of a Hospital Marketing Department and Hours They Spend Marketing Foodservice

The respondents were asked to indicate if their hospital had a marketing department and how many hours this department marketed the foodservice department. Thirty-nine percent (N = 28) of the 71 hospitals reporting had a marketing department. Of those hospitals having a hospital marketing department, 14 reported no time and five indicated less than one hour was spent marketing the foodservice department. Seven percent had marketing departments that marketed the foodservice department for one to two hours, while in four hospitals greater than two hours was utilized (Table II).

Marketing Techniques Currently Utilized

To determine the marketing techniques used by the foodservice department, respondents were asked to denote on the questionnaire the techniques currently being used at the time of the survey. Four marketing groups were identified and analyzed by the researcher. These groups were marketing to techniques for in-house patients, hospital employees, the community at large and hospital visitors.

<u>Marketing Techniques Used for</u>

<u>In-House Patients</u>

Ninety-two percent (N = 65) of the respondents used guest trays to market foodservice to in-house patients. Special holiday or "theme" menus were used by 89% (N = 63) and birthday or best wishes cakes were used by 65% (N = 46) of the responding hospitals. Research by Somers (1987) indicated special holiday meals (90%) and birthday cakes (88%) were used by hospitals in Indiana to market the foodservice department to in-house patients. Pickens and Shanklin (1985) also found special holiday meals (89.8%) and theme menus (35%) were used as a marketing technique for in-house patients.

Two hospitals used wine service, three hospitals used gourmet menus, and one hospital used menus featuring guest chef recipes as marketing techniques for in-house patients. Under "other" techniques listed by the respondents, one hospital marketed gift boxes and one hospital marketed a flyer (pamphlet) with employee signatures that were responsible for the meal to in-house patients. Table III illustrates the marketing techniques for in-house patients.

<u>Marketing Techniques Used for</u>

<u>Hospital Employees</u>

The popularity of marketing the cafeteria to hospital employees was utilized by 90% (N = 64) of the hospitals providing cafeteria service to employees, 78% (N = 55) offering discounted cafeteria meals, 52% (N = 37) advertising the cafeteria menu, and 49% (N = 35) offering take-out service. Vending was marketed by the foodservice department to hospital employees by 47% (N = 33) of the hospitals. Restaurant service

TABLE III

MARKETING TECHNIQUES USED FOR IN-HOUSE PATIENTS

Marketing Techniques	Frequency	Percentage
(1) Guest tray	65	91.5

(21) Gift boxes	1	1.4
(22) Restaurant	1	1.4

and pizza franchise were reported by four hospitals as marketing tech-
niques to employees. "Other" marketing techniques reported by the re-
spondents included blue plate specials, the sale of monogram mugs, body
composition testing, and free meal on the employees birthday. One hos-
pital did not have a cafeteria but did offer employee meals (Table IV).

Again, this supports previous research completed by previous
researchers. Somers (1987) reported that cafeteria service was marketed
by 97% and vending was marketed by 71% of the hospitals in Indiana.
Pickens and Shanklin (1985) found that 93% of the responding hospitals
marketed cafeteria service and 65% marketed vending to employees.

Marketing Techniques Used for the
Community at Large

As illustrated in Table V, nutritional counseling was marketed by
the foodservice department to the community at large by 73% (N = 52) of
the hospitals participating in the study. Somers (1987) found that 68%
of the hospitals in Indiana used nutritional counseling to market
hospital foodservice to the community while Pickens and Shanklin (1985)
reported that 75% of their respondents used this technique.

Forty-three (61%) of the hospitals marketed cafeteria service and
39% offered weight reduction programs to the community at large. Thirty-
seven percent (N = 26) of the participants marketed nutritional programs
for civic organizations to the community at large. Foodservice to jails
and restaurants were marketed by three of the responding hospitals.
"Other" marketing techniques used for the community at large included
body composition testing, a newsletter, contract meals to another
agency, and wellness classes.

TABLE IV

MARKETING TECHNIQUES USED FOR HOSPITAL EMPLOYEES

(25) Special diets	4	5.6
(26) Foodservice to jails	3	4.2
(27) Restaurant service	3	4.2
(28) Other	4	5.6

Marketing Techniques Used for Visitors

Eighty-five percent (N = 60) of the respondents indicated that cafeteria service was used to market the foodservice department to hospital visitors. Once again, the data corresponded with the information reported in previous studies. Somers (1987) reported that 90% and Pickens and Shanklin (1985) reported that 82.7% of the hospitals marketed the foodservice department to visitors via the cafeteria.

Guest trays to patient rooms were marketed by the foodservice department to visitors by 82% (N = 58) of the hospitals participating in the study. National Nutrition Month promotions were used by 41 of the hospitals' foodservice departments. Employee arts and crafts show, contest and games, body composition testing, special diets, and promotional meals were listed as "other" marketing techniques used for visitors. Table VI illustrates the marketing techniques used for visitors.

Importance of Marketing Techniques

With one being the least important and five the most important, respondents were asked to rate specific marketing techniques according to how significant they perceived each technique is in the marketing process. Of the 14 specific marketing techniques listed, reputation was ranked as most important (rating of 5) by 80% (N = 57) of the respondents.

A marketing technique with a rating of four or higher was considered as a very significant technique utilized by the respondents in the marketing process. Feedback (85.9%), market niche (84.5%), and internal marketing (77.5%) were rated as very important by more than

TABLE VI

MARKETING TECHNIQUES USED FOR VISITORS

Marketing Techniques	Frequency	Percentage
(1) Cafeteria service	60	84.5
(2) Guest trays to patient room	58	81.7
(3) National nutrition month promotions	41	57.7
(4) Vending service	34	47.9
(5) Take-out service	30	42.3
(6) Specialty bars	28	39.4
(7) Cafeteria menu advertisement	26	36.6
(8) Fast food service	17	23.9
(9) Bake shop	10	14.1
(10) Deli	6	8.5

(16) Body composition testing	1	1.4
(17) Special promotion meals	1	1.4

three-fourths of the respondents. Fifty-one of the respondents ranked public relations as very important, while merchandising and marketing plans were rated as very important by 49 of the respondents.

Mass marketing (33.8%) and advertising (28.2%) were given a lower ranking by respondents. This may be due to the fact that these marketing techniques were more expensive to implement than the other techniques (Table VII).

Statistical Analysis

H1: The characteristics of the respondents (age, sex, years of experience, level of education, professional affiliation, current position, employment status, and number of hours spent in marketing) will have no effect on the marketing techniques utilized by hospitals located in Oklahoma. Specific marketing techniques were examined for:

a. In-house patients

b. Hospital employees

c. Community

d. Hospital visitors

Chi-square values were used to determine the relationships between the eight respondent characteristics and the four categories of marketing techniques referred to in the null hypothesis.

Marketing to In-House Patients by
Respondent Variables

The analyses indicated that 20 significant associations ($p \leq .05$) existed between respondent characteristics and the marketing techniques used for in-house patients. Table VIII contains the chi-square values

TABLE VII

IMPORTANCE OF MARKETING TECHNIQUES

Marketing Technique	Least Important 0 (%)*	1 (%)	2 (%)	3 (%)	4 (%)	Most Important 5 (%)

(See Appendix B, pages 129-248)

examining the significant relationships between respondent characteristics and the marketing techniques used for in-house patients.

Those respondents who were registered members of the American Dietetic Association (ADA) (p=.004), members of American Society for Hospital Foodservice Administrators (ASHFSA) (p=.013), and those who had a Bachelor of Science degree or higher (p=.004) were more likely to market fruit baskets to in-house patients than those respondents not possessing these characteristics.

Birthday or best wishes cakes, which was used by 46% of the respondents as a marketing technique to in-house patients, was significantly related to current positions, hours spent in marketing and affiliation of the respondents. Those respondents whose current position was reported as department head or foodservice director were more likely to use this technique (p=.017) than those who reported their current position as administrator, clinical dietitian, or supervisor. Membership in ADA (p=.028), ASHSFA (p=.031) and the Dietary Managers Association (DMA) (p=.012) were also more likely to use this technique than other respondents not members of these associations. A significant association existed between respondents who reported that they spend more than one hour per week marketing foodservice and the use of birthday or best wishes cakes (p=.016).

Refreshment cart was more likely used as a marketing technique to in-house patients by those respondents who reported their age as 40 and older (p=.021). There was a significant association between congregate dining with families and male respondents (p=.038) and with those respondents who were younger than 40 years of age (p=.037).

While only 8.5% of the respondents were members of the National Restaurant Association (NRA), those respondents demonstrated highly significant relationships with the in-patient marketing techniques of gourmet menus that describe food origins (p<.001), elegant in-room dining (p=.001), menus featuring guest chef recipes (p=.001), restaurant (p=.001) and specialty stores (p=.001). This indicates that their training provides greater confidence in implementing "trendy" or more current marketing techniques to in-house patients.

A very significant association was reported between those respondents who had over 30 years experience in foodservice and the in-house patient marketing techniques of menus featuring guest chef recipes (p=.001). Those respondents with more than 10 years experience were more likely to market cookbooks (p=.006) than those with 10 or less years of experience. This also indicates that years of experience may increase the level of confidence toward marketing.

It is interesting to note that those respondents with a high school diploma as the highest level of education were more likely to use 24-hour room service as a marketing technique to in-house patients than those respondents with a higher level of education. These respondents using this technique presumably have acquired other marketing techniques from colleagues.

While only three respondents reported part-time employment (less than 35 hours per week), those respondents were more likely to have a tray favors program for children (p=.007) than those respondents who reported working full-time (35 or more hours per week). Those respondents who work full-time generally have a routine schedule and may either be too busy or to involved in the day-to-day operations to implement this type of marketing technique to patients.

Marketing to Employees by
Respondent Characteristics

Cafeteria service was the number one marketing technique used for
employees and the results of this study revealed a significant relation-
ship between cafeteria service to employees and the current position of
the respondent. Sixty-two percent of the total respondents were
currently in the position of foodservice director or department head in
a hospital in which the cafeteria was marketed to employees (p=.009)
(Table IX).

Respondents who reported membership in the NRA were more likely
to market fast foodservice to hospital employees than non NRA respond-
ents. It is interesting to note that while only nine of the 22 ASHFSA
members are currently marketing fast foodservice to hospital employees,
they also were more likely to market this technique than non ASHFSA
respondents (p=.043).

There was a high significance between vending service to employees
and gender. Male respondents were much more likely to offer this
service than did the female respondents (p=.002). Those respondents who
were less than 40 years old were more likely to market vending than
the older respondents (p=.015). Vending has been reported in trade
journals as a sleeping giant in hospitals that has potential for real
growth in bottom line profits. Historically, vending has been con-
tracted out and profits of 7 to 10 percent have been earned by
hospitals. It is not surprising that the younger population have begun
to increase these profits to 40-50% ("The Ins and Outs," 1988).

Take-out service to hospital employees is another market that is
projected to grow. There was a significant association between take-out

(See Appendix B, pages 129-248)

service and respondents who were currently in the position of food-service director (p=.023) and respondents who were members of ASHFSA (p=.002).

Two significant associations existed between respondent characteristics and the marketing of a bake shop to employees. The independent variable NRA membership was significantly related to the marketing techniques of bake shop (p=.015). Fifty percent of the respondents with NRA membership reported marketing a bake shop to employees. It may interest the reader that of the three respondents reporting part-time employment status, two respondents reported marketing a bake shop to employees (p=.012).

There was a direct association between professional affiliation and the marketing of a deli to employees. Those respondents who were members of NRA (p=.022), ASHFSA (p=.048), and the Institute of Food Technologists (IFT) (p=.032) were more likely to market this technique to employees than respondents who did not report membership in these organizations.

Four significant associations existed between the characteristics of the respondents and marketing specialty bars (i.e., potato bar, salad bar, taco bar, etc.) to employees. Specialty bars were reported as a marketing technique to employees more often by respondents whose current position was listed as foodservice director or department head (p=.015) and by those respondents whose level of education was a B.S. degree or higher (p=.024). The respondents who reported membership in ADA (p=.013) and ASHFSA (p=.014) likewise reported greater use of specialty bars than those respondents not in these professional affiliations. In contrast, the analysis showed that those respondents

with membership in the Dietary Managers Association (p=.005) were much less likely to use specialty bars as a marketing technique than non DMA members.

The marketing of party trays to employees was significantly associated with current positions (p=.005), level of education (p=.017), ADA membership (p=.032), and membership in ASHFSA (p=.025). Once again the researcher noted that respondents whose current position was food-service director, whose level of education was reported at a B.S. degree or higher, and whose professional affiliations were ADA or ASHFSA, tended to use this technique more often than those respondents not reporting these characteristics.

This trend continued as the chi-square analysis revealed similar significant associations between the marketing of a full catering pro-gram and respondent characteristics. Fifty percent of the respondents who reported their current positions as foodservice director marketed a full catering program (p=.002). Since 81% of those whose current position is reported as foodservice director have a B.S. degree or higher, it is not surprising to see that a significant relationship exists between this technique and level of education of the respondents (p=.021). A full catering program was more often marketed to hospital employees by respondents whose professional membership was affiliated with ASHFSA (p<.001), NRA (p=.005), ADA (p=.011), and IFT (p=.038) than those respondents not reporting membership in these organizations.

A significant association was reported between marketing "theme" dining environments to employees and the respondent variables, current position and professional affiliation. Those respondents whose current position was reported as foodservice director were more likely to use

this technique than those respondents whose current position was reported as administrator, clinical dietitian, or supervisor (p=.013). Respondents with membership in ADA (p=.002) and ASHFSA (p=.008) once more used this technique to a greater degree than those respondents not affiliated with these professional groups. Those respondents with membership in the DMA reported less use of "theme" dining environments than non DMA respondents.

A significant association existed between providing meals to night shift employees and current position (p=.005). Fifty percent of those respondents who are currently in the position of foodservice director are using this technique while only 2.6% of the respondents who are administrators, clinical dietitians, and supervisors are providing meals to the night shift employees. Those respondents with membership in ASHFSA (p=.013), ADA (p=.024), and IFT (p=.045) have a greater tendency to provide meals to the night shift employees than those respondents who are not members of these associations.

Three significant associations were noted between the respondents' characteristics and the marketing of a weight reduction program. Those respondents whose age was less than 40 marketed weight reduction programs more often than those respondents whose age was 40 and older (p=.044). Respondents whose current position was foodservice director (p=.046) and respondents with membership in ASHFSA (p=.030) marketed this technique more often than those respondents not reporting these characteristics.

The respondent characteristic, affiliations, had a significant association with six of the marketing techniques to employees. Those respondents who reported membership in ADA (p=.039) and NRA (p=.024) marketed nutritious cuisine in the cafeteria more often than non ADA

and NRA respondents. Respondents with membership in IFT (p=.001), NRA (p=.024), and ADA (p=.039) marketed delivery of birthday cakes to employees more often than those respondents not members of these affiliations. It is interesting to note that foodservice directors that market birthday cakes to employees generally spend three to four hours marketing foodservice. Respondents who were ADA members (p=.032) were more likely to market a pizza franchise to employees than non ADA members. Members of NRA acknowledged greater use of new product samples (p=.036), nutritional analysis of cafeteria food (p=.024), and cafeteria menu advertisement (p=.014) than did non NRA respondents. Members in these associations not only are revenue driven, but are provided more exposure to business and industry which allows greater insights toward marketing and the availability of new products.

Marketing to the Community at Large
by Respondent Characteristics

Chi-square analyses were computed to determine whether a relationship existed between respondent characteristics and the marketing techniques used for the community. Table X contains the chi-square values for the significant relationships between respondent characteristics and current marketing practices to the community. The analyses indicated that 23 of the marketing techniques for the community were significantly (p≤.05) related to respondent characteristics.

Two significant associations existed between nutritional counseling to the community at large and the respondents' characteristics current position (p=.031) and ADA membership (p=.006). Those respondents who were in the position of foodservice director or department head and

(See Appendix B, pages 129-248)

those with ADA membership were more likely to market nutritional counseling to the community than those respondents not reporting these characteristics. Generally, a prerequisite for ADA membership is training in nutritional counseling and administration and this would indicate the tendency for dietitians to market this technique to the community.

Four significant associations existed between weight reduction programs offered to the community at large and the respondent characteristics. Those respondents that marketed weight reduction programs were more likely to be clinical dietitians (p=.043), have a B.S. degree or higher (p=.002) and be members in ADA (p<.001) or ASHFSA (p=.023). Members of ADA (p=.032) and ASHFSA (p=.050) were also more likely to market special diets to community residents than nonmembers of these organizations.

It should be noted by the reader that nutritional screening programs were more likely to be offered by respondents who were younger than 40 years old (p=.036) than by the older respondents. A very significant relationship existed in wellness classes and respondents with over 30 years experience (p=.001). These respondents were more likely to offer wellness classes than the younger respondents. This may be due to the fact that the older respondents are more concerned with cardiac problems that occur with aging and become more health conscious because they recognize the value of a healty life-style.

The marketing of cookbooks and/or other nutrition related pamphlets was very significantly related to age. Those respondents less than 40 years old (p=.001) were more likely to market this technique than those respondents 40 years old and older. Those respondents who

have obtained a B.S. degree or higher (p=.016) and who were ADA members (p=.002) reported marketing of cookbooks and other nutrition related pamphlets more than respondents who did not have these characteristics.

With the increase in the older population, it was observed that members of the NRA (p=.022) were not as likely to market congregate meals for senior citizens, whereas those with IFT membership (p=.032) were more apt to market this technique. Meals on wheels was also marketed to senior citizens. ASHFSA members (p=.025) were more likely to market this program to the community at large than non ASHFSA members.

Cafeteria service was marketed more often by those respondents who were food service directors or department heads (p=.042), who were employed full-time (p=.028), and who were members of ASHFSA (p=.014) than those respondents that did not demonstrate those characteristics. There was a highly significant association between cafeteria service and members of DMA (p=.002). Members of DMA were less likely to market cafeteria services to the community at large than non DMA members. Members of ASHFSA (p=.043) were also more likely to market fast food-service to the community at large than non ASHFSA members. While ASHFSA members are generally located in large hospitals, DMA members are usually employed in hospitals located in small communities. Many times these hospitals are too small to offer this service.

Hospital dietary departments occasionally market their food and services to other institutions that do not have adequate facilities or personnel to provide these services. Seven significant relationships existed between characteristic respondents and marketing techniques that provide foodservice to other facilities within the community.

Members of NRA (p=.008) were more likely to provide foodservice to skilled nursing facilities and ASHFSA (p=.001) and IFT (p=.006) members marketed their foodservices more often to day care centers than non-members of these organizations. ASHFSA (p=.001) members also provided consultation services to other facilities more than non ASHFS members. It may interest the reader to know that respondents that provided consultation services to other facilities generally spent more than one hour marketing foodservice (p=.048). Dietitian support for home health care was more often marketed by members of IFT (p=.045) than non IFT members and by respondents that were younger than 40 years old (p=.028). Dietitian support for home health care is a new concept and the respondents may not know how to market this technique.

Catering takes on many forms in foodservice. Significant associations were noted for three forms of catering and the characteristics of the respondents. Catering programs for events outside the hospital was very significantly related to age (p=.001). Those respondents younger than 40 were more involved in catering events outside the hospital than the older respondents. Male respondents (p=.017), respondents with a college education (p=.036), and members of ASHFSA (p=.017) marketed this technique more than respondents without these characteristics.

Banquet service was more often used by respondents who were members of NRA (p=.004), ASHFSA (p=.035), and IFT (p=.006) than non-members of these organizations. It should be noted that marketing a bakery to the community at large was utilized considerably more by NRA members than non NRA members.

Catering to civic groups was significantly related to level of education, current position, and affiliation. Those respondents that reported greater involvement in marketing this technique were currently foodservice directors or department heads (p=.002), have a B.S. degree or higher (p=.032), and were members of ADA (p=.011) or ASHFSA (p<.001). While catering is not limited to large cities, it is a revenue driven marketing technique that is used to secure more of the market share which is associated with greater populated cities. Members of ASHFSA, NRA, ADA, and IFT also tended to be more profit oriented than those not in these affiliations.

Nutritional education to the community can be marketed in a variety of ways. Four nutritional programs to the community demonstrated significant relationships with the characteristics of the respondents. Nutritional programs were provided to schools by those respondents who were affiliated with ADA (p=.014), ASHFSA (p=.013), and IFT (p=.008) than nonmembers of these associations. It may interest the reader to know that respondents that market nutritional programs for schools tend to spend more than three hours per week marketing foodservice. Those respondents who were less than 40 years old (p=.016), who had obtained a B.S. degree or higher (p=.021), who were in current positions of foodservice director or department head (p=.013), and who were members of ADA (p=.011) or ASHFSA (p=.008) were more likely to provide training for university or vocational-technical (vo-tech) students than were those respondents not possessing these characteristics. Respondents with a B.S. degree or higher (p=.036) and members of ADA (p=001) or ASHFSA (p=.008) marketed nutritional programs for civic organizations and other clubs while those without these characteristics did not.

Providing nutritional information via the news media had three very significant (p=.001) associations with the respondent characteristics, level of education, and membership in ADA and ASHFSA. Those respondents who had a B.S. degree or higher and membership in ADA or ASHFSA were more responsive to providing nutrition information via the news media than members without a college degree or not members of ADA or ASHFSA. Significant associations were also reported with this technique by respondents who were younger than 40 (p=.010), who were in the position of foodservice director or department head (p=.009), and were members of IFT (p=.022). Respondents that marketed this technique more often to the community spent between one and two hours per week (p=.011) marketing the foodservice department than those respondents spending more or less time marketing foodservice. Members of the Dietary Managers Association (p=.005) were not as likely to market nutritional information through the news media as did non DMA members. DMA members are usually located in rural hospitals that do not have access to the news media or newspapers as do nonrural hospitals.

Marketing to Visitors by Respondent
Characteristics

The chi-square analysis indicated that 25 significant associations existed between respondent characteristics and the marketing techniques used for visitors (Table XI). Cafeteria service was very significantly related to current position. Those respondents who were in the position of foodservice director or department head (p=.001) were more likely to market cafeteria service. The cafeteria menu was more often advertised by NRA members (p=.013) than by non NRA members. It may interest the

reader to note that one respondent employed part-time (less than 35 hours per week) (p<.001) reported marketing special promotion meals to visitors and that one respondent with over 30 years experience (p=.039) reported marketing special diets to visitors.

Take-out service was marketed more often by those respondents whose current position was foodservice director or department head (p=.010) and by those respondents who were either ASHFSA (p=.015) or NRA (p=.033) members. As has been the trend, specialty bars (potato, salad, sandwich, etc.) were marketed more often by respondents whose current position was foodservice director or department head (p=.007), who had a B.S. degree or higher education (p=.003), and who were ADA (p=.007) or ASHFSA (p=.005) members than those not reporting these characteristics. Those respondents who market specialty bars tend to spend between one and two hours per week marketing foodservice(p=.045).

National Nutrition Month promotions were also used more often by foodservice directors (p<.001), those with a college degree (p<.001), and those who were ADA (p<.001) and ASHFSA (p<.001) members than by those respondents without these characteristics. Respondents who market National Nutrition Month reported that they spend more than three hours marketing foodservice (p=.039). A very significant association existed between these techniques and members of DMA. DMA members (p<.001) did not market specialty bars (p<.001) or National Nutrition Month (p<.001) to visitors.

Members of NRA (p=.010) reported marketing fast foodservice to visitors more often than non NRA members; while vending was marketed more often by men (p=.002) than women and by those respondents younger than 40 (p=.025). The respondents with membership in NRA (p=.022) and

IFT (p=.032) reported marketing a deli more often than non NRA or non IFT members. IFT members (p=.013) as well as ADA members (p=.028) marketed the technique, bake shop, more often than nonmembers of these associations.

When asked to list other marketing techniques to visitors, two respondents listed an employee arts and crafts show. The respondent characteristics, ASHFSA (p=.032) and employment part-time (p=.001), were more likely to provide an employee arts and crafts show than respondents without these characteristics.

The analyses revealed that respondent characteristics were associated with marketing techniques for in-house patients, employees, the community at large, and for hospital visitors. Based on the results shown in Tables VIII, IX, X, and XI, the researcher rejects parts a, b, c, and d of Hypothesis One.

H2: The characteristics of the institution (management of the foodservice department, hospital classification, number of beds, average number of meals served daily, population of the city, existence of a hospital marketing department and the number of hours the hospital marketing department spends marketing foodservice) will have no effect on the marketing techniques utilized by hospitals located in Oklahoma. Marketing techniques examined were:

a. In-house patients

b. Hospital employees

c. Community

d. Hospital visitors

Chi-square values were used to determine the associations between the six institutional characteristics and the four categories of marketing techniques referred to in the null hypothesis.

Marketing to In-House Patients by

Institutional Characteristics

There was a significant association between the marketing of guest trays to in-house patients and hospital affiliation and the number of beds. Hospitals that provided guest trays to patients were usually city or county operated (p=.036) and those with 300 or less beds (p=.015) (Table XII).

Wine service is generally offered to in-house patients to increase revenue. This is supported by results of the chi-square analysis in which wine service was more often marketed to in-house patients by those responding hospitals who were for profit (p=.001) and corporate owned (p=.032) than by hospitals not having these institutional characteristics.

A significant relationship existed between the marketing of fruit baskets to patients and foodservice being managed by a contract food company (p=.025), religious affiliation (p=.038), number of beds (p=.001), average number of meals served (p<.001), population of city (p=.043), the existence of a hospital marketing department (p=.032), and the hours the marketing department utilizes marketing the foodservice department (p=.022). Fruit baskets were marketed more often in hospitals which were managed by a contract food company and have religious affiliations. These hospitals have over 300 beds and produce over 1000 meals per day. Only hospitals that were located in cities with a population of over 500,000 have these characteristics. The hospitals marketing fruit baskets most often have a marketing department and this department spends less than one hour marketing foodservice.

(See Appendix B, pages 129-248)

While hospitals that were federal government operated (p=.046) did not offer congratulatory meal for new parents, those that have religious affiliation (p=.024) generally offered this service to new parents. Most of the hospitals operated by the federal government in Oklahoma are Veteran Administration hospitals that do not provide maternity care. The respondents reported that larger hospitals with greater than 300 beds (p=.045) market congratulatory meals more often than smaller hospitals.

Birthday or best wishes cakes were marketed by respondents whose hospitals were over 100 beds (p=.003) and produced over 300 meals per day (p=.004). A very significant association existed between those hospitals having a marketing department and the marketing of birthday or best wishes cakes. Respondents whose hospitals had a marketing department (p<.001) were more likely to market birthday or best wishes cakes to in-house patients. When asked to respond to other marketing techniques used for in-house patients, respondents in hospitals that were operated by the federal government (p=.002) and were located in cities greater than 500,000 (p=.030) responded that birthday cards were marketed to in-house patients.

It is interesting to note that respondents whose hospitals were designated not for profit (p=.021) were more likely to market a refreshment cart to in-house patients than respondents from hospitals that were for profit. Respondents whose hospitals were government owned but managed by a hospital corporation were less likely to market special holiday or "theme" menus to in-house patients than respondents in hospitals not possessing this characteristic.

Only respondents who were in the larger hospitals (over 300 beds) (p=.039) and in cities that had a population of greater than 500,000 (p=.015) marketed gourmet menus that described food origin to in-house patients. These gourmet menus were more often marketed in hospitals which had a marketing department (p=.028) and which marketed foodservice one to two hours per week (p=.028).

A very significant association existed between menus featuring guest chef recipes and those hospitals who were corporate owned (p=.001). Hospitals whose dietary department was managed by a contract food company (p=.013) and who were designated for profit (p=.019) demonstrated a significant association with this institutional characteristic. Administration in hospitals with these characteristics intuitively know that they must show bottom line profits and therefore, they must be versatile and have the expertise to generate revenue. Bringing in a guest chef or even using recipes that represent a guest chef also denotes quality and produces public relations that will bring in the profits.

Five significant relationships existed between marketing health-wise dishes to in-patients by indicating these dishes with a symbol on the menu and the hospital characteristics. The respondents indicated that hospitals using this technique were more likely located in a city with a population of 500,000 or greater (p=.001), generally have a bed capacity over 300 (p=.003), and on the average, produced over 999 meals per day (p=.012). These hospitals' foodservice departments were more often managed by a contract food company (p<.001) and had a hospital marketing department (p=.005) than hospitals without these characteristics.

Elegant in-room dining was a marketing technique that was used more often by hospitals that were located in cities with a population greater than 500,000 (p=.015), which have over 300 beds (p=.015), and which produce over 1,000 meals per day (p=.041) than in small hospitals located in towns with less population. Congregate dining with families was further significantly associated with hospitals located in cities with a population of 500,000 or greater (p=.004). Religious affiliated hospitals (p=.003) tended to offer congregate dining with families more often than hospitals without this designation. Once again, the research analysis presents the marketing arena in which larger hospitals must compete to gain a bigger share of the available profits.

A significant association existed between the two independent variables, management of the foodservice and population of the city and the marketing techniques, specialty stores and restaurant service. Institutions with a contract foodservice were more likely to market a specialty store (p=.013) and a restaurant (p=.013) than those hospitals managing their own foodservice department. Those hospitals which were located in larger cities that had a population of over 500,000 were more likely to market specialty stores (p=.030) and restaurant service (p=.030) than hospitals located in smaller towns.

Cookbooks were more likely marketed to in-house patients by hospitals with contract foodservice (p=.035) than in hospitals that manage their own foodservice.

It should be noted that under other marketing techniques to in-patients, one hospital located in a large city (population >500,000) reported the use of gift boxes (p=.030). One other hospital operated by the federal government (p=.002) and located in a larger city in

Oklahoma reported that a flyer is sent to patients with the employees' signature that was responsible for the meal. This is considered an excellent internal marketing tool.

Marketing to Hospital Employees by Institutional Characteristics

Cafeteria service to employees was marketed more often in not for profit hospitals (p=.044) and in hospitals having a marketing department (p=.025) than by hospitals which did not have these characteristics (Table XIII). A very significant association existed between federal government operated hospitals and the marketing techniques, cafeteria service to employees and discounted cafeteria meals. These hospitals were less likely to offer cafeteria service (p<.001) or discounted cafeteria meals (p=.001) to employees than other hospitals. It is interesting to note that hospitals that were city or county government operated (p=.024) were also less likely to offer discounted cafeteria meals to employees than those hospitals not city or county government operated. Hospitals with more than 100 beds (p=.018), that served over 300 meals per day (p=.013), and who had a marketing department (p=.009) were more likely to advertise their cafeteria menus than hospitals without these characteristics.

Nutritious cuisine or health conscious meals are more often marketed by those hospitals that have an occupancy of more than 300 beds (p=.034) and that are located in cities with a population of 500,000 or greater (p=.034) than smaller hospitals located in smaller towns. Nutritional analysis of the cafeteria food was provided more often in hospitals that were corporate owned (p=.024) and that had a

(See Appendix B, pages 129-248)

marketing department (p=.034) than those without these characteristics. In those hospitals that had a marketing department, this technique was marketed more often when greater than one hour was spent marketing the foodservice department (p=.036) than when foodservice was marketed less than one hour.

The marketing of "theme" dining environments to attract employees to the cafeteria had a very significant association with number of beds, average number of meals, and the existence of a hospital marketing department. Those hospitals which had a bed capacity of over 300 (p<.001), served over 300 meals per day (p<.001), and had a hospital marketing department (p<.001) were more likely to market "theme" dining to employees. Considering that hospitals of this size are located in cities with a population of 500,000 residents, it is not surprising that the population of the city (p=.008) was significantly associated with "theme" dining environments. It may interest the reader to know that one hospital managed by a contract food management company reported marketing "blue plate specials" to employees (p=.013).

While many of the "trendy" marketing techniques are localized to the larger hospitals, specialty bars such as potato bars, salad bars, and sandwich bars are marketed by hospitals that are mid-sized and larger. Specialty bars were marketed more often to employees in hospitals that were located in cities with a population of 50,000 or more residents (p=.010), that were over 100 beds (p<.001), and that serve 300 or more meals per day (p=.001). This technique was marketed to employees more often when a hospital marketing department existed (p<.001) and when the marketing department spent one to two hours marketing foodservice (p=.024). Specialty bars were not marketed by hospitals which were operated by the federal government (p=.029).

The technique of marketing employee contests in the cafeteria was used more often by hospitals that were classified as for profit (p=.006), that had 101-300 beds (p=.039), that served an average of 300-999 meals per day (p=.007), and that had a marketing department (p=.032) than by those hospitals not having these characteristics. The reader is reminded that hospitals that are considered small (<100 beds) do not generally have the staff to market contests to employees in the cafeteria, while the larger hospitals (>300 beds) have patients that require a higher acuity of care and there is not as much time for these "fun and games" to take place.

An extension to the hospital cafeteria is the marketing of take-out service to employees. This technique was marketed more often by hospitals located in towns that had a population greater than 50,000 (p=.005), who had more than 100 beds (p<.001), and served more than 300 meals per day (p=.001) than by hospitals with less beds located in smaller towns.

The dependent variable, provision of meals for night shift employees who work from 11:00 p.m. until 7:00 a.m., was significantly associated with the independent variables, classification of the hospital, number of beds, and average number of meals served daily. Hospitals that were classified not for profit (p=.048), that had a bed occupancy of 101-300 (p=.008), and served an average of 300-999 meals per day (p=.027) were more likely to provide meals for the late shift employees than hospitals not possessing these characteristics. Hospitals that were operated by the federal government did not provide meals for these employees. As previously stated, small hospitals generally do not have the staff to provide meals to late shift employees;

and while many large hospitals provide foodservice 24 hours per day, this service may not necessarily be considered as a marketing technique to the night shift employees. Late shift employees were definitely considered when making the decision to offer "round-the-clock" food-service.

The marketing of fast foods to employees was significantly related to the population of the city and very significantly associated with number of beds, average number of meals, and the existence of a hospital marketing department. Hospitals marketing fast food were more often located in cities with a population of 500,000 or larger (p=.022), had greater than 300 beds (p=.001), served more than 1,000 meals per day (p<.001), and had a hospital marketing department (p=.001). A deli was marketed more often by hospitals that were in the larger cities (population <500,000) (p=.005), that had over 300 beds (p=.004), and that served more than 1,000 meals per day (p=.017). Number of beds (p=.004) and average number of beds (p=.009) was also significantly associated with the marketing of a pizza franchise.

Restaurant foodservice, which is slowly making its way into hospitals, was more likely to be marketed by hospitals in Oklahoma whose foodservice department is managed by a contract management company (p=.034), and in larger hospitals which have over 300 beds (p=.004), and who serve more than 1,000 meals per day (p=.009) than by hospitals that manage their own foodservice and that are smaller. Larger hospitals tend to have more expertise in marketing foodservice and appear unafraid to experiment with many of the current marketing trends. The foodservice directors of larger hospitals also have insight to the value the foodservice department can bring to their department by pro-ducing revenue that contributes to the overall hospital profits.

Vending was significantly associated with hospital classification and the existence of a marketing department. Religious affiliated hospitals (p=.013) marketed vending more often than those hospitals with no religious affiliation. Hospitals which were operated by the federal government (p=.009) did not market vending as often as those hospitals that were nonfederal government operated. Hospitals that had a marketing department (p=.004) were more likely to market vending services than those without a marketing department.

As has been the trend, a very significant association existed between the marketing of a full catering program to employees and number of beds, average number of meals served daily, and the existence of a marketing department. Hospitals with more than 300 beds (p=.001), that served an average of more than 300 meals per day (p<.001), and which had a marketing department (p<.001) were more likely to market a full catering program to employees than hospitals without these characteristics. This technique was also marketed more often in hospitals located in cities with a population of 500,000 or greater (p=.017) than hospitals in smaller towns. Due to the fact that catering is an excellent revenue producer, it is no consequence that hospitals whose foodservice department is managed by a contract food management company (p=.044) participated in this technique more often than hospitals that managed their own foodservice departments. It should be noted that hospitals that are city or county operated generally did not market a full catering program to employees (p=.035). In communities where a hospital was managed by the city or county government the hospital tended to be concerned that the hospital may be in competition with other catering businesses in the community and therefore, tended to not enter this market.

As was with the marketing of a full catering program, the marketing of party trays had a very significant association with number of beds, average number of meals served daily, and the existence of a marketing department. Those hospitals that had over 300 beds (p<.001), that produced more than an average pf 300 meals per day (p=.000), and that had a hospital marketing department (p<.001) were more likely to market party trays to employees than hospitals without these characteristics. If the hospital had a marketing department, this department was more likely to market party trays when one to two hours (p=.047) were spent marketing foodservice. These hospitals, as one might expect, were generally located in cities with a population of 500,000 or greater (p=.011). Hospitals with contract foodservice (p=.004) were more likely to market party trays than those hospitals that manage their own foodservice departments.

Contrary to the researcher's expectations, hospitals that were classified as not for profit were more likely to market nutrition consultation (p=.019) to employees than hospitals that were for profit. Hospitals that had between 101 and 300 beds (p=.019) marketed weight reduction programs to hospitals' employees more often than smaller or larger hospitals. The independent variable, existence of a hospital marketing department also had a significant association with weight reduction programs (p=.026). Those hospitals with a marketing department tended to market weight reduction programs more often than those hospitals that did not have a marketing department. It may interest the reader to note that a significant association existed between the amount of time the marketing department spent marketing foodservice and weight reduction programs. Hospitals with marketing departments

spending less than one hour marketing foodservice (p=.020) were more apt to market weight reduction programs than hospitals that spent either no time or more time marketing foodservice. The marketing of weight reduction programs to employees has been around for a long time and is considered by the researcher as a basic marketing technique for most hospital employees. The more time a marketing specialist spends marketing a department the more he/she gets to know that department and its potential for growth, thus increasing the marketability of the foodservice department.

Only one hospital reported the marketing of body composition testing to employees. This hospital was city or county operated (p=.033) and the marketing department spent greater than two hours per week (p=.024) marketing the foodservice department.

There was a significant relationship between birthday cakes to employees and hospital size, average number of meals served, and the existence of a marketing department. Hospitals that had 101-300 beds (p=.029), served an average of 300-999 meals per day (p=.005), and had a marketing department (p=.006) marketed birthday cakes to employees more often than those hospitals without these characteristics. One hospital that was religious affiliated reported providing employees with a birthday meal (p<.001).

Seven significant relationships existed between the characteristics of the institution and separate physician dining. Separate dining was marketed more often to physicians by large hospitals with over 300 beds (p=.004), located in cities with a population of 500,000 or more residents (p=.011), that serve more than 1,000 meals per day (p=.004) than smaller hospitals located in towns with less residents. Hospitals

with contract foodservice (p=.004) and those with religious affiliation (p=.050) were more likely to market separate phsician dining than other hospitals. Hospitals with a marketing department (p=.003) were more apt to market separate physician dining than hospitals without a marketing department. This technique was used more often by hospitals whose marketing department spent less than one hour marketing foodservice (p<.001) than by those spending more or less than one hour marketing foodservice.

When asked to list other marketing techniques to employees, one hospital reported the sale of monogram mugs. It may interest the reader to note that this hospital's foodservice was managed by a contract food management company (p=.013). This type of creative marketing is used by a food management company to increase revenues and to advertise their company.

Marketing to the Community at Large by
Institutional Characteristics

A very significant association (p=.001) existed between the management of the foodservice department by a contract food management company and the marketing of a catering program for events outside the hospitals (Table XIV). These hospitals were more likely to market catering to the community than hospitals that managed their own foodservice department. Restaurant service (p=.007) was also marketed more often to the community by hospitals with contract foodservice than by those who managed their own foodservice.

For profit hospitals were more likely to market newsletters (p=.019), foodservice to skilled nursing facilities (p=.021), and

provide meals and food for breaks to office buildings (p=.004) in the
community than hospitals that are not for profit. Hospitals that were
classified as not for profit were more likely to provide dietitian
support for home health care (p=.048) than those hospitals that were
for profit. Corporate owned hospitals were more likely to provide
nutritional screening programs (p=.050) and nutritional counseling
(p=.021) than those hospitals that were not corporate owned. It may
interest the reader to note that one hospital that was religious
affiliated but managed by a hospital corporation marketed a newsletter
to the community (p<.001). It is clear that hospitals which are managed
by a food management firm, that are classified for profit and that are
corporate owned are interested in increasing profits by marketing
services that may have a direct influence on the revenue produced.

The size of the hospital had a definite relationship with marketing
Hospitals that were operated by the city or county government were
more committed to the community. These hospitals provided foodservice
to jails (p=.027) and provided congregate meals for senior citizens
more often than hospitals not operated by these municipalities. One
hospital operated by a city or county government reported marketing
contract meals to another agency (p=.033). Results from the data showed
that hospitals operated by the federal government were less likely to
market cafeteria services to the community (p=.008) than those hospitals
not operated by the federal government.

The size of the hospital had a definite relationship with marketing
techniques used to market foodservice to the community (Table XIV).
Small hospitals (100 or less beds) were less likely to market weight
reduction programs (p=.006), dietitian support for home health care
(p=.019), nutritional information through the news media (p=.001),

provide nutritional programs for civic organizations (p=.026), and have catering programs for events outside the hospital (p=.005) than hospitals with more than 100 beds.

Medium sized hospitals (101-300 beds) were more likely to market nutritional counseling (p=.001), meals on wheels programs (p=.039), discounted meals to the elderly (p=.003), foodservice to skilled nursing facilities (p=.002) and training for students (p<.001) than smaller or larger hospitals. Large hospitals that have over 300 beds were more likely to market cafeteria service (p<.001), fast foodservice (p<.001), restaurant service (p<.001), banquet service (p<.001), cater to civic groups (p<.001), bakery (p=.014), consultation services to other facilities (p=.018), nutritional screening programs (p=.002), and cookbooks or other nutrition related pamphlets (p=.010) than smaller hospitals.

As institutions increase in size the greater is their ability to market foodservice programs to the community. Not only does their staff have experience and expertise, but the hospital's physical plant can generally accommodate the services that are marketed. For example, many small hospitals cannot market cafeteria service to the community because the cafeteria does not have the seating capacity to provide for the additional guests.

There was a direct relationship between the number of meals a hospital served each day and the marketing techniques used to market foodservice to the community. Hospitals that served 100 or less meals per day did not market a bakery (p=.007) to the community. Hospitals that served an average of 300-999 meals per day more likely marketed nutritional counseling (p=.013), meals on wheels programs (p=.040),

foodservice to skilled nursing facilities (p=.010), catering program for events outside the hospital (p=.006), cater to civic groups (p<.001), and provide nutritional programs for civic organizations (p=.034) than did hospitals serving more or less meals per day.

Six very significant associations existed between hospitals that served an average of 1,000 meals or more per day and the marketing techniques to the community. These hospitals were more likely to market cafeteria service (p=.001), fast foods (p<.001), restaurant service (p=.001), banquet service (p<.001), nutritional information through the news media (p=.001), and training for food and nutrition students (p=.001) than hospitals that serve less than 1,000 meals per day. They also marketed nutritional screening programs (p=.018), and cookbooks or other nutrition related pamphlets (p=.036) more often than hospitals serving less meals.

A significant relationship existed between independent variable, population of city, and the marketing techniques to the community. Hospitals located in cities with a population of 50,000 to 499,999 residents were more likely to provide training for university or vocational-technical students (p=.005) than hospitals located in smaller or larger cities. Hospitals located in the largest communities, where there are 500,000 or more residents, marketed fast foods (p=.022), restaurant service (p=.008), banquet service (p=.020), and contract meals to another agency (p=.030) more often than hospitals located in smaller communities.

The existence of a marketing department was very significantly associated with five of the marketing techniques used by hospitals to the community. Hospitals with a marketing department were more likely

to provide training for food and nutrition students (p<.001), cater to civic groups (p<.001), cater events outside the hospital (p<.001), provide fast foodservice (p=.001), and provide nutritional information through the news media (p=.001) than hospitals without a marketing department. Other significant associations are listed in Table XIV.

It is interesting to note that there were significant associations between the amount of time a hospital's marketing department spent marketing the foodservice department and the marketing techniques to the community. Those hospitals in which the marketing department spent less than one hour marketing foodservice provided congregate meals for senior citizens (p=.021), discounted meals to the elderly (p=.012), and nutritional information through the news media (p=.047) more often than hospitals whose marketing department spent more time marketing foodservice. A very significant association was found between the marketing of a bakery to the community and the time spent by the marketing department marketing foodservice. A bakery (p=.001) was more likely to be marketed to the community when the marketing department spent one to two hours marketing the foodservice department than when less or more marketing time was used. When more than two hours was spent marketing the foodservice department, the hospital was more likely to provide consultation services to other facilities (p=.001). Table XIV contains the chi-square values examining the significant associations between the independent variable, time spent by the marketing department marketing foodservice, and the marketing techniques to the community.

Marketing Techniques to Visitors by

Institutional Characteristics

The analyses indicated that 13 of the marketing techniques for hospital visitors were significantly related ($p \leq .05$) to institutional characteristics (Table XV). The independent variable management of the foodservice department was significantly related to National Nutrition Month promotions ($p=.026$), pizza parlor ($p=.013$), and restaurant service ($p=.034$). Hospitals with contract foodservice utilized these marketing techniques to visitors more often than hospitals managing their own foodservice. Not for profit hospitals marketed cafeteria service ($p=.043$) more often than for profit hospitals. There was a significant association between religious affiliated hospitals and the marketing techniques vending ($p=.016$) and advertisement of the cafeteria menu ($p=.020$). Religious affiliated hospitals were more likely to market these techniques than were other hospitals. Hospitals managed by the federal government were less likely to market take-out foodservice ($p=.017$), cafeteria service ($p<.001$), and specialty bars ($p=.025$) than other hospitals. City or county government operated hospitals were less likely to market National Nutrition Month promotions ($p=.029$), vending service ($p=.048$), or advertisement of the cafeteria menu ($p=.017$) than hospitals not operated by a city or county government. Only one hospital operated by a city or county government reported the marketing of body composition testing to visitors ($p=.033$).

There was a significant association between the independent variable, number of beds, and the marketing techniques to visitors. Hospitals that had 100 or less beds were less likely to market National Nutrition Month promotions ($p<.001$), specialty bars ($p<.001$), a deli

(See Appendix B, pages 129-248)

(p=.010), a bakery (p=.002), and take-out foodservice (p<.001) than hospitals that were larger. Hospitals that had 101 to 300 beds (p=.025) were more likely to market cafeteria service to visitors than hospitals of other sizes. Hospitals with over 300 beds were more likely to market fast foods (p=.004) and restaurant service (p=.004) than smaller hospitals.

A significant association existed between average number of meals served and marketing techniques to visitors. Those hospitals that served less than 300 meals were less likely to market National Nutrition Month promotions (p<.001), a deli (p=.017), a bakery (p=.003), and take-out foodservice (p=.003) than hospitals serving more than 300 meals. Cafeteria service (p=.049) was marketed more often in hospitals that serve 300 to 999 meals per day than those that serve less or more meals per day. Fast foods (p<.001) and specialty bars (p<.001) were marketed more often in hospitals that served an average of 1,000 or more meals per day than those hospitals that served fewer meals.

The analyses of the data revealed that seven of the marketing techniques for hospital visitors were significantly related to the institutional characteristic, hospital marketing department. Hospitals with a marketing department were more likely to market fast foods (p=.003), cafeteria service (p=.004), vending (p=.007), take-out foods (p=.011), bakery (p=.033), specialty bars (p<.001), and National Nutrition Month promotions (p<.001) to visitors than hospitals that do not have a marketing department. A bake shop (p=.037) was marketed more often in hospitals in which the marketing department spends one to two hours marketing foodservice than in hospitals spending more or less time marketing foodservice. It is interesting to note that when body

composition testing (p=.024) is marketed to visitors that the hospital marketing department spent greater than two hours marketing the food-service department.

The analyses revealed a significant association between institutional characteristics and marketing techniques for in-house patients, employees, the community at large, and for hospital visitors. The researcher, therefore, rejects a, b, c, and d of Hypothesis Two.

H3: The characteristics of the respondents (age, sex, years of experience, level of education, professional affiliations, current position, employment status, and number of hours spent in marketing) will have no effect on the perceived importance of marketing techniques. Specific techniques examined were:

  a. Marketing plan

  b. New product development

  c. Mass marketing

  d. Target marketing

  e. Market niche

  f. Product diversification

  g. Discounting

  h. Merchandising

  i. Advertising

  j. Sales promotions

  k. Public relations

  l. Feedback

  m. Reputation

  n. Internal marketing

With one (1) being the least important and five (5) being the most important respondents were asked to rank 14 specific techniques according to their importance in the foodservice marketing process. Using Chi-Square Analysis nine significant associations were found at $p \leq .05$ (Table XVI).

New product development, which is generating and introducing new products into the market place, was viewed by members of the American Society for Hospital Foodservice Administrators (ASHFSA) as more important than those respondents not affiliated with this association. Of the 22 ASHFSA respondents, 18 felt that this technique was most important ($p=.027$). ASHFSA membership in Oklahoma is generally associated with hospitals in larger cities where greater competition among hospitals exists.

New product development was also rated higher by the respondents whose current position is defined as department head or foodservice director ($p=.025$). These respondents generally have greater foodservice responsibility and are more aware of the total foodservice operations than the hospital administrator, clinical dietitian, or foodservice supervisor.

Those respondents who spend greater than two hours per week marketing the foodservice department rated new product development as more important than those respondents that spend less than two hours per week ($p=.013$). Those foodservice administrators who have greater marketing participation intuitively know that marketing reflects the needs and wants of the perspective customer. The development of new products provides the products that customers desire.

(See Appendix B, pages 129-248)

Product diversification is the strategy of marketing new products to new sets of customers. Respondents who were members of the National Restaurant Association (NRA) rated this technique as four or greater in importance (p=.014) while the Dietary Managers Association (DMA) respondents rated this technique as four or less (p=.047). Restaurant managers have long been aware that it takes this type of marketing to keep new customers patronizing their establishments and it is not surprising that Dietary Managers did not rate product diversification higher because they are mainly taught basic foodservice operations. Marketing of foodservice departments is an area of study that may need to be considered in the Vocational-Technical curriculum for Dietary Managers.

Of the 22 ASHFSA respondents answering the section of importance of marketing techniques, all members of this affiliation rated how the foodservice department was viewed by the customer as very important (p=.043). ASHFSA is a national organization with membership at the national and/or state level. They have been orienting their membership regarding marketing techniques since the onset of government regulations in hospitals. While the reputation of the foodservice may not be the reason a customer selects a hospital, it may very well be the reason a customer decides not to utilize the services of a particular hospital.

Internal marketing is satisfying the needs and wants of the foodservice employee while viewing them as internal customers and their jobs as internal products. Of the 43 foodservice directors responding to the importance of this specific technique, 54% rated this as most important (p=.013). Thirty-five of the respondents that listed their current position as foodservice director or department head generally

had obtained a Bachelor of Science or higher degree. It is assumed that those respondents have been educated regarding the value of internal marketing in the foodservice industry.

Two respondents reported membership in the Institute of Food Technologists (IFT) and it is interesting to note that they rated public relations as three (p=.045). This may be due to the fact that this affiliation is more interested in the quality of a food product than the marketing of foodservices through activities that promote favorable relationships with the public.

Feedback is obtaining information regarding the product or service from customers through various channels. Patron surveys may be a source of feedback in hospitals. Those respondents who spend more than one hour per week marketing foodservice felt that feedback was of greater importance than those respondents who spend less than one hour per week marketing foodservice (p=.048). Those who are attentive to marketing are interested in the customer's perception of the food and the service. With this information the foodservice director can continue to bring quality products to future clients.

Nine significant associations (p$\leq$.05) were noted between respondent characteristics and the perceived importance of marketing. Based on the association between the respondents' variables and the perceived importance of new product development, product diversification, public relations, feedback, reputation, and internal marketing relationships the researcher rejects parts b, f, k, l, m, and n of Hypothesis Three. There was no association between the respondent variables and the perceived importance of marketing plan, mass marketing, target marketing, market niche, discounting, merchandising, advertising, and sales

promotions and therefore, the researcher fails to reject parts a, c, d, e, g, h, i, and j of Hypothesis Three.

H4. Institutional characteristics (management of foodservice department, hospital classification, number of beds, average number of meals served daily, population of the city, and existence of a hospital marketing department) will have no effect on the foodservice director's perceived importance of marketing techniques. Specific techniques examined were the same as stated in Hypothesis Three.

Three significant associations were identified between contract foodservice management and the importance of foodservice marketing (Table XVII). Institutions with contract foodservice management rated advertising (p=.011), sales promotions (p=.038) and merchandising (p=.024) as significantly more important than those hospitals who manage their own foodservice departments. Somers (1987) reported that respondents employed by a contract foodservice company were more likely to rate advertising (p=.009) and merchandising (p<.10) more important than respondents employed by the hospital. A significant relationship (p$\leq$.05) was also noted between the foodservice departments managed by contract foodservice companies and the perceived importance of merchandising and advertising in research results conducted by Pickens and Shanklin (1985). Those with contract foodservice management are aware that the bottom line must reflect profits to the hospital and to their company. Therefore, they are well trained in stimulating the customer to patronize their establishment and to buy their products. These relationships document their commitment to increase revenue not only through advertising and sales promotions, but by promoting the sale of a product through quality presentation.

p				.009

(See Appendix B, pages 129-248)

Hospitals located in cities with a population of 50,000 or more rated advertising significantly higher than those located in smaller towns (p=.025). These hospitals also indicated that new product development was more important than those hospitals located in towns of less than 50,000 residents (p=.032). Large metropolitan cities are accustomed to competition but Oklahoma has a number of rural hospitals that are located in small towns of less than 50,000. Historically, these hospitals have treated only patients from their town and have not felt the need to compete by advertising and developing new products. The trend is for the government to designate regional referral hospitals and these smaller hospitals will have to become more market oriented to keep their share of customers.

Merchandising was indeed considered more important in hospitals that serve over 300 meals per day (p=.045). These hospitals generally have foodservice directors with a higher degree of education managing the dietary department. They have learned that proper merchandising provides appealing food that promotes the sale of a product through presentation.

The Chi-Square Analysis indicated a trend of high significance (p=.009) between hospitals that have a marketing department and the importance of internal marketing. Those designated as marketing directors intuitively understand that marketing begins internally and then extends outward to the public.

Seven significant associations (p≤.05) were noted between institutional characteristics and the perceived importance of marketing. Institutional characteristics effected the perceived importance of new product development, merchandising, advertising, sales promotions, and

internal marketing. Therefore, the researcher rejects parts b, h, i, j, and n of Hypothesis Four. Institutional characteristics had no effect on market plan, mass marketing, target marketing, market niche, product diversification, discounting, public relations, feedback, and reputation. The researcher fails to reject parts a, c, d, e, f, g, k, l, and m of Hypothesis Four.

CHAPTER V

SUMMARY, RECOMMENDATIONS AND IMPLICATIONS

Pickens and Shanklin (1985) and Somers (1987) have completed two previous studies that specifically looked at the marketing techniques of hospital foodservice departments. The aim of this study was to identify the marketing techniques utilized by hospital foodservice departments to in-house patients, hospital employees, the community at large, and hospital visitors, and to determine the perceived importance of specified marketing techniques by foodservice directors in Oklahoma.

Summary

The results of the data collected from the questionnaires completed by Oklahoma hospital foodservice directors are presented in Chapter IV. The sample, which is the same as the population consisted of all Oklahoma hospitals. Data obtained from 71 usable questionnaires were analyzed using chi-square analysis.

The respondents were predominately female, between the ages of 20 and 59. Forty-six respondents had completed a Bachelor of Science degree or higher, 13 respondents had vocational-technical training, and 8 had a high school education. Only one respondent had not completed high school. Forty-eight percent of the respondents were registered members of the American Dietetic Association (ADA) and 31 percent were affiliated with the American Society for Hospital Foodservice Directors

(ASHFSA), while 35 percent were members of the Dietary Managers Association (DMA). Six respondents were members of the National Restaurant Association (NRA) and two members were affiliated with the Institute of Food Technologists. The majority of the respondents were employed full-time, were in the current position of foodservice director or department head, had between six and fourteen years of total foodservice experience and spent less than three hours per week marketing the foodservice department (Table I).

Sixty-one percent of the respondents indicated that the food-service department was managed by the hospital rather than by a contract foodservice management company and 63 percent were classified as not for profit operations. Six hospitals were corporate owned, seven hospitals were federally operated while 13 were city or county operated. In addition, four were classified as a hospital corporation and five were religious affiliated. Sixty-nine percent of the respondents were employed in hospitals located in cities of less than 50,000 residents and 78 percent of the hospitals had 200 beds or less. Thirty-nine percent of the hospitals served an average of less than 200 meals per day, while 11 percent served more than 1000 meals per day. Twenty-eight of the 71 hospitals had a marketing department. Fourteen re-spondents indicated that the hospital marketing department did not market the foodservice department, five reported the marketing depart-ment spent less than one hour, and nine reported that the marketing department spent 1-2 hours marketing the foodservice department (Table II).

Ninety-two percent of the foodservice directors indicated that they used the marketing technique of providing guest trays to patients.

Eighty-eight percent used special holiday or "theme" menus and 65 percent used birthday or best wishes cakes as marketing techniques to patients. One technique listed by a respondent under "Other" marketing techniques was a flyer sent to patients with employee signatures responsible for the meal (Table III).

Cafeteria service was the predominant technique used by respondents for employees. While 90 percent of the respondents indicated that the cafeteria was marketed to employees, 78 percent used discounted cafeteria meals, 52 percent advertised the cafeteria menu, and 49 percent offered take-out service as marketing techniques to hospital employees. Vending which has been encouraged through trade journals (Beasley, 1990), was marketed to employees by only 47 percent of the respondents. The traditional marketing technique, nutrition consultation, was used by 45 percent of the respondents (Table IV).

Seventy-three percent of the survey participants used nutritional counseling to market hospital foodservice to the community. Cafeteria service was marketed to the community by 71 percent of the respondents. Dietitian support for home health, which is a new concept in foodservice marketing, was marketed by 34 percent of the respondents. While foodservice to senior citizens has been targeted by trade journals as a market niche for hospital foodservice departments (Beasley, 1987; Sampson, 1990; "Washington Hospital," 1989), only 24 percent of the respondents marketed Meals on Wheels program, 20 percent reported the sale of convenience meals, 18 percent marketed discounted meals, and 9 percent indicated congregate meals were being marketed to the elderly (Table V). It may interest the reader that one hospital marketed a newsletter to the community.

Eighty-five of the respondents used the cafeteria and 82 percent used guest trays to patient rooms as a marketing technique to visitors. National Nutrition Month promotions were used by 58 percent and vending was marketed to visitors by 48 percent of the respondents. Five "Other" techniques were listed as marketing techniques to visitors. These included employee arts and crafts show (N = 2), contest and games (N = 1), body composition testing (N = 1), special diets served (N = 2), and promotion meals (N = 1) (Table VI).

On a scale of one to five, 93 percent of the respondents ranked reputation as very important (ranked 4 or 5). Feedback (86%), market niche (85%) and internal marketing (78%) were also rated as very important by the respondents. The survey participants rated mass marketing (34%) and advertising (28%) lower than other marketing techniques (Table VII).

The four hypotheses were tested and the characteristics of the respondents (age, sex, years of experience, level of education, professional affiliation, current position, employment status, and number of hours spent in marketing) were associated with marketing techniques for in-house patients, hospital employees, the community at large, and hospital visitors (Tables VIII, IX, X, and XI). The characteristics of the institutions (management of the foodservice department, hospital classification, number of beds, average number of meals served daily, population of the city, existence of a hospital marketing department and the hours spent marketing) were also associated with the marketing techniques used for in-house patients, hospital employees, the community at large, and hospital visitors (Tables XII, XIII, XIV, and XV). Tables XVI and XVII illustrate the associations that existed between the

characteristics of the respondents and the characteristics of the institutions and the foodservice director's perceived importance of marketing techniques.

Recommendations

Recommendations regarding the research instrument are concerned with the fact that question number nine of section three was confusing. Respondents were asked to select all the classifications that applied to their hospital. Many respondents answered only one part of this question rather than all that applied. This question could have been divided into two parts, with the first question asking to identify if the institution is for profit or not for profit. Then the respondents could be asked to indicate the classification of their hospital regarding corporate owned, government operated, religious affiliation.

Approximately six percent of the respondents did not answer Section II of the questionnaire. The survey participants were asked to rate specific marketing techniques according to how significant they felt each technique was to the marketing process. Even though the respondents were given a definition of the specific marketing techniques that were to be rated, the terminology may have not been familiar to the survey participants. The use of the word "felt" may also have discouraged survey participants to respond.

In the past, hospitals foodservice departments have marketed their services primarily to the in-patient because hospitals depended on this market for its principal revenue. As hospitals become more competitive and revenue driven, it is imperative that foodservice directors become aware of the evolving marketing trends that may contribute to the

bottom line profits. Research regarding the marketing techniques of hospital foodservice departments has been limited. Research regarding foodservice marketing techniques needs to be conducted periodically and to a much broader audience, to ascertain the current marketing techniques utilized by a random number of hospital foodservice directors by states, region, or nationwide.

Implications

The characteristics of the respondents and the characteristics of the institutions had an association with the marketing techniques utilized to in-patients, hospital employees, the community at large, and hospital visitors. In general, those respondents with more experience, whose current position was foodservice director, who had a B.S. degree or higher, who was affiliated with ADA, NRA, or ASHFSA, who spent time marketing the foodservice department implemented more marketing techniques than survey participants who did not have these characteristics. Those respondents whose hospitals were located in cities of over 500,000 residents, that have over 300 beds, that serve over 1,000 meals per day and which were classified for profit utilized more marketing techniques to in-house patients, hospital employees, the community at large and hospital visitors than those without these characteristics. Hospitals with these characteristics tend to employ foodservice directors with the aforementioned characteristics, thereby implying that a relationship exists between the characteristics of the respondents and the characteristics of the institutions and the type of marketing techniques used by the foodservice department.

The characteristics of the respondents and the characteristics of the institutions were also associated with the foodservice director's perceived importance of marketing techniques. Those respondents whose current position was foodservice director or department head and whose hospitals had a marketing department indicated that internal marketing was very important. New product development was reported as very important by respondents whose current position was foodservice director, who were affiliated with ASHFSA, who marketed the foodservice department more than two hours per day, and whose hospitals were located in cities greater than 50,000 residents.

While foodservice directors are aware that marketing is important to the success of the hospital foodservice department, many are not aware of current marketing trends. Trade journals indicate that vending, take-out meals, and marketing to seniors, to name a few, are the marketing techniques currently being explored by hospital foodservice departments. No matter how small the institution, the foodservice director must be informed and willing to take the risks that are required to market the foodservice department. Results of this study, as well as those reported by Somers (1987), and Pickens and Shanklin (1985), need to be disseminated widely to hospital foodservice directors. This could be accomplished through workshops, professional seminars, and articles in trade or professional journals. The foodservice director can then determine which marketing techniques are best suited for their facility and develop a strategic marketing plan for the foodservice department.

September 12, 1990

Dear Food Service Director:

We would like to ask your assistance in a research survey on "Marketing Strategies in Healthcare Foodservice Departments." Your participation in the endeavor will assist in identifying marketing strategies utilized by foodservice directors in Oklahoma and marketing techniques believed to be important to the success of the foodservice department.

The information you convey to us will be held in strict confidence. At no time will you or the facilities you serve be identified in the research report.

It will take approximately 15 minutes to complete this questionnaire. Please return the completed survey on or before October 1, 1990. If you have any questions, please call (405) 372-1480, ext. 450 and ask for Edith.

If you would like to have a summary of the results please provide your name and address on the questionnaire where indicated. Thank you for your cooperation and professional assistance.

Sincerely,

Edith M. Gierlatowicz, RD/LD
Food Service Director
Stillwater Medical Center
Graduate Student

Lea L. Ebro, Ph.D., RD/LD

Celebrating the Past   Preparing for the Future

STILLWATER MEDICAL CENTER

September 12, 1990

Dear colleague:

Please find enclosed a questionnaire that Edith Gierlatowicz, R.D., a Master's Degree candidate and Dietary Director, has developed. Research regarding marketing activities in healthcare food service departments has been limited nationwide. Since there have been no studies conducted in Oklahoma on the subject, I support Edith as she completes this final phase of her research and I have participated in reviewing the questionnaire. We are asking the hospitals in Oklahoma to participate in this study.

It is hoped that this research will provide valuable information to professional organizations, healthcare institutions, educational institutions, the food service industry, and dietary directors like yourself. It is intended that this information be made available to participating dietary directors and the profession at large.

Please use the self-addressed, stamped envelope to return the questionnaire to Edith. She would very much appreciate a timely response. Thank you for your assistance and participation in this study.

Sincerely,

Paul Dougherty
Chief Executive Officer

SECTION I: MARKETING TECHNIQUES CURRENTLY UTILIZED

Instructions: Please answer all of the questions by placing a check mark in the blank before the answer that best reflects your hospital's involvement in the marketing of your dietary department's activities. List other techniques utilized by your department at the end of each question.

1. The following marketing techniques are used to market hospital food service to **in-house patients** (Check as many as apply):

   _____ 1. "Guest" Trays
   _____ 2. Wine Service
   _____ 3. Fruit Baskets
   _____ 4. Congratulation Meals for New Parents
   _____ 5. Special Holiday or Theme Menus
   _____ 6. Twenty-Four Hour Room Service
   _____ 7. Restaurant-Style Menus
   _____ 8. Birthday or Best Wishes Cakes
   _____ 9. Refreshment Cart
   _____ 10. Gourmet Menus that Describe Food Origins
   _____ 11. Tray Favor Programs for Children
   _____ 12. Menus featuring Guest Chef Recipes
   _____ 13. Symbols on Menus to Indicate Health-Wise Dishes
   _____ 14. Buffet-Style Pediatric Carts
   _____ 15. Elegant In-Room Dining
   _____ 16. Congregate Dining with Families
   _____ 17. Suite Service with Waiters
   _____ 18. Cookbooks
   _____ 19. Take Home Meals
   _____ 20. Family Style Food Service
   _____ 21. Specialty Stores
   _____ 22. Other (Please Specify): _____
   _____

2. The following marketing techniques are utilized to market hospital food to **visitors** (Check as many as apply):

   _____ 1. Cafeteria Service
   _____ 2. Fast Food Service
   _____ 3. Restaurant Service
   _____ 4. Vending Service
   _____ 5. Take-Out Service
   _____ 6. Bake Shop
   _____ 7. Deli
   _____ 8. Pizza Parlor
   _____ 9. Specialty Bars, i.e., Potato, Salad, Sandwich
   _____ 10. Guest Trays to the Patient's Room
   _____ 11. Cafeteria Menu Advertisement
   _____ 12. National Nutrition Month Promotions
   _____ 13. Other (Please Specify): _____
   _____

(2)

3. The following marketing techniques are utilized to market hospital food service to **hospital employees** (Check as many as apply):

_____ 1. Cafeteria Service
_____ 2. Fast Food Service
_____ 3. Restaurant Service
_____ 4. Vending Service
_____ 5. Take-Out Service
_____ 6. Bake Shop
_____ 7. Deli
_____ 8. Specialty Bars, i.e., Potato, Salad, Sandwich
_____ 9. Pizza Franchise
_____ 10. Party Trays
_____ 11. Full Catering Program
_____ 12. Themed Dining Environments
_____ 13. Employee Contests in the Cafeteria
_____ 14. New Product Samples
_____ 15. Nutrition Consultation
_____ 16. Nutritional Analysis of Cafeteria Food is Provided
_____ 17. Cafeteria Menu is Advertised
_____ 18. Provision of Meals for Night Shift Employees
_____ 19. Nutritions Cuisine Served in the Cafeteria
_____ 20. Discounted Hospital Cafeteria Meals
_____ 21 Birthday Cakes available for delivery to employees
_____ 22. Weight Reduction Program
_____ 23. Modified Food Provided for Employees on Modified Diets
_____ 24. Cookbooks
_____ 25. Separate Physician Dining
_____ 26. Other (Please Specify): _____
_____
_____

4. The following techniques are utilized to market hospital food service to the **community at large** (Check as many as apply)·

_____ 1. Nutritional Counseling
_____ 2. Weight Reduction Programs
_____ 3. Congregate Meals for Senior Citizens
_____ 4. Meals on Wheels Program
_____ 5. Convenience Meals for Sale to the Elderly
_____ 6. Cafeteria Service
_____ 7. Fast Food Service
_____ 8. Restaurant Service
_____ 9. Food Service to Skilled Nursing Facilities
_____ 10. Food Service to Daycare Centers
_____ 11. Food Service to School Lunchrooms
_____ 12. Food Service to Jails
_____ 13. Dietitian Support for Home Health Care
_____ 14. Sale of Nutritional Support Products
_____ 15. Catering Programs for Events Outside Hospital
_____ 16. Providing Nutritional Information through News Media
_____ 17. Nutritional Programs for Civic Organizations and Clubs
_____ 18. Nutritional Programs for Schools
_____ 19. Provide Meals and Food for Breaks to Office Buildings

(3)

Marketing Techniques utilized to the **community at large** (continued)
(Check all that apply):

_____ 20. Discounted Hospital Meals to the Elderly
_____ 21. Provide Training for University and/or Vo-Tech Food Service Students
_____ 22. Provide Consultation Services to Other Facilities
_____ 23. Nutritional Screening Programs
_____ 24. Cookbooks and/or Nutrition Related Pamphlets
_____ 25. Bakery
_____ 26. Banquet Service
_____ 27. Cater to Civic Groups
_____ 28. Other (Please Specify): _____

_____
_____

SECTION II: IMPORTANCE OF MARKETING TECHNIQUES

Instructions: With **one (1)** being the **least** important and **five (5)** the **most** important, please rate each marketing technique according to how significant you feel each technique is in the marketing process.

1. MARKETING PLAN (Guidelines for your department which are consistent with hospital strategies, goals, and objectives for setting the broad directions for marketing efforts.)
   Least 1 2 3 4 5 Most

2. NEW PRODUCT DEVELOPMENT (Generating and introducing new products to the market place)
   Least 1 2 3 4 5 Most

3. MASS MARKETING (One attempts to market the same product or service to everyone.)
   Least 1 2 3 4 5 Most

4. TARGET MARKET (One particular market segment pinpointed as a primary customer group.)
   Least 1 2 3 4 5 Most

5. MARKET NICHE (Realizing that you cannot be all things to all people, you find the spot that fits your objectives and goals and meets a particular need.)
   Least 1 2 3 4 5 Most

6. PRODUCT DIVERSIFICATION (The strategy of marketing new products to new sets of customers.)
   Least 1 2 3 4 5 Most

7. DISCOUNTING (Reducing the price for services to a select group of users.)
   Least 1 2 3 4 5 Most

8. MERCHANDISING (Promoting the sale of a product through presentation.)
   Least 1 2 3 4 5 Most

(4)

9. ADVERTISING (Any paid, persuasive message used to call public attention to a service or product to arouse a desire to buy or patronize.)
   Least   1   2   3   4   5   Most

10. SALES PROMOTIONS (Those promotional activities, other than advertising, personal selling, and publicity, that stimulate customers to buy.)
    Least   1   2   3   4   5   Most

11. PUBLIC RELATIONS (Activities to promote favorable relationship with the public, i.e. seminars, conferences.)
    Least   1   2   3   4   5   Most

12. FEEDBACK (Obtaining information regarding the product or service from the customer, i.e. patron surveys.)
    Least   1   2   3   4   5   Most

13. REPUTATION (How your department/services are viewed by the consumer.)
    Least   1   2   3   4   5   Most

14. INTERNAL MARKETING (Satisfying the needs and wants of the Foodservice employee while viewing them as internal customers and their jobs as internal products.)
    Least   1   2   3   4   5   Most

SECTION III: GENERAL INFORMATION

Instructions: The information included in this questionnaire is confidential and will be used for research purposes only. Please answer all questions that describe you and your facility.

1. Your age is:
   1. _____ 20-29   3. _____ 40-49   5. _____ 60-69
   2. _____ 30-39   4. _____ 50-59   6. _____ 70 or Over

2. Your sex is
   1. _____ Female   2. _____ Male

3. Your total number of years of work experience in foodservice are:
   1. _____ Less than 1 year   5. _____ 16-20 years
   2. _____ 1-5 years   6. _____ 21-25 years
   3. _____ 6-10 years   7. _____ 26-30 years
   4. _____ 11-15 years   8. _____ Over 30 years

4. Your highest level of education is:
   1. _____ High School or GED
   2. _____ Vocational Degree
   3. _____ Associate Degree
   4. _____ Bachelor's Degree
   5. _____ Master's Degree
   6. _____ Ph.D. Degree
   7. _____ Other (Please Specify) _____

(5)

5.   Your professional affiliations include:
      1. _____ American Dietetic Association
              1. _____ Registered   2. _____ Non-Registered
      2. _____ American Society of Hospital Food Service Administrators
      3. _____ National Restaurant Association
      4. _____ Dietary Managers Association
      5. _____ Other (Please Specify): _____

6.   Your current position title is: _____

7.   Your Present Employment Status is.
      1. _____ Full-time (35 or more hours per week)
      2. _____ Part-time (34 hours per week or less)

8.   Management of the Food Service Department is:
      1. _____ Employed by the Hospital
      2. _____ Employed by a Contract Food Service Company
      3. _____ Other (Please Specify) _____

9.   The hospital where you are currently employed is (Check all which apply)·
      1. _____ Not for Profit
      2. _____ For Profit
      3. _____ Corporate Owned
      4. _____ Government Operated (Federal)
      5. _____ Government Operated (City, County)
      6. _____ Owned and Managed by a Hospital Corporation
      7. _____ Religious Affiliation
      8. _____ Other (Please Specify) _____

10.   The number of beds your facility is licensed for is:
      1. _____ Less than 25 Beds   5. _____ 201-300 Beds
      2. _____ 26-50 Beds   6. _____ 301-400 Beds
      3. _____ 51-100 Beds   7. _____ 401-500 Beds
      4. _____ 101-200 Beds   8. _____ Over 500 Beds

11.   Your average number of meals served daily is _____ .

12.   The population of the city in which your hospital is located is:
      1. _____ Less than 10,000   5. _____ 250,000-499,999
      2. _____ 10,000-49,999   6. _____ 500,000-749,999
      3. _____ 50,000-99,999   7. _____ 750,000-1,000,000
      4. _____ 100,000-249,999

13.   Does your hospital have a Marketing Department?
      1. _____ Yes   2. _____ No

14.   If Yes, how many hours do they spend marketing the foodservice department per
      week?
      1. _____ None   3. _____ 1-2 Hours
      2. _____ Less than one   4. _____ More than 2 Hours

(6)

15. How many hours per week do you spend on marketing the foodservice department of your facility?
1. _____ None
2. _____ Less than one
3. _____ 1-2 hours
4. _____ 2-3 hours
5. _____ 3-4 hours
6. _____ Other (Please Specify) _____

Thank you for your assistance. If you would like a summary of the results, please indicate by giving your name and address below.

APPENDIX B

CHI-SQUARE FREQUENCY ANALYSES TABLES FOR THOSE

ASSOCIATIONS WHICH WERE SIGNIFICANT

Key to Tables

In the following tables, the abbreviations used refer to questions on the questionnaire.

PAT refers to marketing techniques utilized to patients; (Section I, Question 1).
    0=No; 1=Yes

VIS refers to marketing techniques utilized to visitors; (Section I, Question 2)
    0=No; 1=Yes

EMP refers to marketing techniques utilized to employees; (Section I, Question 3)
    0=No; 1=Yes

COM refers to marketing techniques utilized to the community at large; (Section I, Question 4)
    0=No; 1=Yes

IMP refers to the importance of selected marketing techniques; (Section II)
    0=No; 1=Yes

INF refers to general information that describes the respondents and the facility. When RINF is used,
the values of the variable have been collapsed; (Section III)

    INF1 refers to the age of the respondents.
        2=<40; 3=40 and older

    INF2 refers to the sex of the respondents.
        1=female; 2=male

    INF3 refers to the respondents' years of experience.
        3=10 or less; 5=11-20; 7=21-30; 8=over 30

    INF4 refers to the respondents' highest level of education.
        0=no degree; 1=high school; 3=Vo-Tech or Assoc. Degree; 4=B.S. Degree or higher

    INF5 refers to professional affiliations of the respondents.
        5_1=ADA; 5_2=Registered ADA member; 5_3=Non-registered ADA member; 5_4=ASHFSA; 5_5=NRA;
        6_6=DMA; 5_8=IFT

    RINF6 refers to current position of the respondents.
        ADA=administrator; DHD=department head or foodservice director; DIET=clinical dietitian;
        MGR=dietary manager or supervisor

    INF7 refers to employment status of the respondents.
        1=full-time; 2=part-time

    INF8 refers to management of the foodservice department.
        1=hospital; 2=contract foodservice company

    INF9 refers to hospital classification (0=no; 1=yes)
        INF9_1 = not for profit
        INF9_2 = for profit
        INF9_3 = corporate owned
        INF9_4 = federal government operated
        INF9_5 = city, county government operated
        INF9_6 = owned and managed by a hospital corporation
        INF9_7 = religious affiliation
        INF9_8 = religious affiliated but managed by hospital corporation
        INF9_9 = government owned but managed by a hospital corporation

    RINF10 refers to number of beds
        1=100 or less; 2=101-300; 3=>300

    RINF11 refers to the average number of meals served daily.
        1=<300; 2=300-999; 3=1000 or greater

    RINF12 refers to the population of the city.
        1=<50,000; 2=50,000-499,999; 3=500,000 or greater

    INF13 refers to the existence of a hospital marketing department.
        1=yes; 2=no

    INF14 refers to the number of hours the marketing department spends marketing the foodservice department.
        1=none; 2=<1; 3=1-2; 4=>2

    INF15 refers to the number of hours the respondent spends marketing the foodservice department.
        2=<1; 3=1-2; 4=2-3; 5=>3

VITA

Edith M. Gierlatowicz

Candidate for the Degree of

Master of Science

Thesis: MARKETING TECHNIQUES UTILIZED BY OKLAHOMA HOSPITAL FOODSERVICE
DEPARTMENTS

Major Field: Food, Nutrition and Institution Administration

Biographical:

Personal Data: Born in Atkinson, Georgia, April 24, 1950, the
daughter of Julian B. and Julia H. Middleton. Married to
Brian L. Gierlatowicz on July 14, 1978.

Education: Graduated from Brantley County High School, Nahunta,
Georgia, in May, 1968; received Bachelor of Science Degree
in Home Economics from Georgia College, Milledgeville,
Georgia in June, 1972; completed an Administrative Dietetic
Internship at Oklahoma State University, December, 1973;
passed registration exam to meet requirements for American
Dietetic Association membership in May, 1974; completed
requirements for the Masters of Science degree at Oklahoma
State University in May, 1991.

Professional Experience: Clinical Dietitian, University Hospital
of Jacksonville, Jacksonville, Florida, January, 1974 to
