CHAPTER I

Introduction

The concept of Area Vocational-Technical Training Centers was introduced in the 1963 Vocational Education Act. This act suggests that training should be provided for all who desire it, need it, and show the initiative to obtain it. The specific provisions in the 1963 Vocational Education Act provide training of: (1) high school students; (2) full-time study for persons who have completed or left high school; (3) persons presently employed, but needing training or retraining to achieve stability or advancement in employment; and (4) persons who have academic, socio-economic or other handicaps that prevent them from succeeding in the regular vocational education program. The 1963 Vocational Education Act was amended by the 1968 Vocational Education Amendments, but did not change the provisions for establishment of Area Vocational-Technical Training Centers by the States [10, 11].

Comprehensive high schools are not likely to be seen in Oklahoma for many years. Small high schools normally offer only one or two vocational courses in their curriculum. Many of these school districts are not financially capable of offering a larger number of vocational courses.

The Area Vocational-Technical Training Center concept is a method derived to provide training in trades and skills at the apprentice

1

level, where a need exists and employment can be obtained. These
centers can be situated so they are within a reasonable commuting
distance of all residents in the State of Oklahoma. The theory behind
the area school concept is to assist each independent school in
offering a greater number of vocational subjects to youth and adults.

Statement of the Problem or Situation

The plan for establishing area vocational-technical training
districts is authorized by the Constitutional Amendment as provided in
State Question 434.

The location of the first area vocational-technical training
centers did not create a problem. After several of these centers were
established, other independent districts discovered that they were not
a part of surrounding area vocational-technical districts nor possessed
the necessary resources to establish an area vocational-technical
training district. This created chaos in planning since planners of
area vocational-technical training centers desire to make a school
available to every high school student and adult in the State of
Oklahoma.

The problem is three-fold. First it is necessary to determine
area districts. The area districts are limited by certain minimum
factors specified by the Department of Vocational-Technical Education
and approved by the State Board for Vocational Education. These factors
are: (1) The proposed area vocational-technical district should have
a total minimum scholastic population of 15,000 or serve approximately
a fifty mile radius from the proposed site of the center. (2) The

proposed area vocational-technical district shall have a minimum

net assessed evaluation of $40,000,000 after homestead exemptions.

The second problem existing after the district boundaries have

been established is to select the location for the school to be built.

This location will be in or near a given town or city.

Third, it is desirable to minimize the number of area vocational-

technical training centers, yet adequately provide training facilities

for the population and stay within the proximity of the restrictions

imposed on the study.

Objectives

The objectives of this study are: (1) to develop a linear

programming model for state-wide planning of area vocational-technical

training centers; (2) to determine the district boundaries for future

area vocational-technical training centers; (3) to establish boundaries

for existing area vocational-technical training centers; (4) to

establish district boundaries so that an area vocational-technical

training center is available to every student and adult in the state;

and (5) to determine the minimum number of area vocational-technical

training centers required to adequately serve the State of Oklahoma.

Significance of Results

This study is restricted to the State of Oklahoma and should

facilitate the administering of federal and state funds to area

vocational-technical training centers: it is restricted to the State

of Oklahoma because every state has different guidelines for

establishing area training centers. The model to be developed has the

possibility of being used by any state desiring to locate schools by this method. The study will provide the valuation of each of the vocational-technical training center locations and will provide the State Department of Vocational-Technical Education with some insight pertaining to the amount of funds necessary for establishing a district. Also, the information resulting from this study gives an indication of the number of students enrolled in the eleventh and twelfth grades within the training center boundaries. The State Department of Vocational-Technical Education may desire to use this kind of information to set priorities for establishing area training centers. The purposes of this study are: (1) to serve the State Department of Vocational-Technical Education in attempting to make a school available to each high school student and adult who wishes to attend; (2) to aid in the selection of districts and sites in order to minimize the average miles traveled per student; (3) to provide answers as to the number of schools needed in Oklahoma; and (4) to provide information for the establishment of a state-wide system of area vocational-technical training centers.

The model developed for this study can aid other states in the location of area vocational-technical training centers as well as be used in the future to locate regional junior colleges, intermediate schools, or any other special schools planned.

Review of Literature

The literature pertaining to the existing area vocational-technical training centers in Oklahoma has been reviewed and the information necessary for the establishment of area vocational-technical

training centers will be included and used in this study. The estab-
lishment of area vocational-technical training centers requires the
districts to vote on forming and then make application for a district.
A five member board has to be elected at large. A tax levy is voted
by the patrons in the newly formed districts to assure the necessary
revenue. The newly formed districts have to show a need for the area
vocational-technical training center by providing evidence of employ-
ment opportunities to the State Board of Vocational Education [9].

The early vocational-technical training districts were able to
meet all the restrictions imposed by the State Department of Vocational-
Technical Education and required very little planning for their
location. The State Department of Vocational-Technical Education
became more selective in approving area vocational-technical training
districts and the location of the training center within the approved
district as more districts made application and were formed. An area
vocational-technical training center should be available to any high
school wishing to become a part of an area district with the provision
that the necessary procedure is carried out for their joining. This
situation has led to the need of state-wide planning of area vocational-
technical training centers.

A study was conducted by John Elmo Uxer at New Mexico State
University to determine an operational research model for locating
area vocational schools. Major characteristics influencing the
location and establishment of area vocational schools were determined
by a series of personal conferences with state and local educational
leaders.

Descriptions of these major characteristics were submitted by Uxer to thirty nationally recognized educational leaders who were asked to rank them in the order of their relative importance.

These ranked factors in order are: (1) number of students by grade level enrolled in public and private schools in the area; (2) total and projected population of the area; (3) industry and business in the area--planned and present; (4) present and predicted state-wide and nation-wide employment opportunities for trainees from vocational and technical education programs; (5) show need (present plus expansion and turnover) in at least five divisions of vocational-technical education; (6) dropout rate of schools in the area; (7) finance resource potential of the area (in addition to that based upon assessed valuation of the area); (8) distance between possible area vocational schools; (9) present tax load in the area; and (10) ability to attract and hold faculty [12].

James Avery Adams of Oklahoma State University conducted a study pertaining to the state-wide planning of intermediate schools. He divided the State of Oklahoma into areas potentially adequate to serve as desirable intermediate units of educational administration. In each respective area special attention was given to the socio-economic factors of total population and pupil population, topography and geography, agricultural regions, economic areas, and trade and service center areas of major trade centers.

Adams mapped off each of these areas and made a single map composed of intermediate districts, following the boundaries established as being best suited to fit all the factors considered [1].

The literature reviewed did not present a plan or model to minimize student miles traveled. No specific system was found to determine the optimum vocational-technical districts boundaries of location of the area school.

Thesis Organization

The remainder of this thesis is divided into three chapters. Chapter II describes the methodology used to determine the optimum location of area vocational-technical training centers. Chapter III will be the presentation and discussion of the recommended area vocational-technical training centers composing the state-wide plan. The final chapter will summarize the previous material presented in the thesis, give the investigator's conclusions, and discuss the need for further research in the area of vocational-technical training centers.

CHAPTER II

Methodology

Many sources were utilized in gathering the information used in
the programming technique. A steering committee was organized and
meetings were conducted to develop the criteria recommended as
standards. The steering committee was composed of the State Director
of Vocational-Technical Education, the Supervisory Staff of Area
Vocational-Technical Training Centers, the Research Coordinating Unit,
and a representative of the Agricultural Education Department at
Oklahoma State University. The absence of information relating to the
economies of size of area vocational-technical training centers for
Oklahoma prompted the steering committee to recommend that the average
miles traveled per student be considered the prime factor in locating
centers. The optimum locations of area vocational-technical training
centers are based on minimizing the average miles traveled per student
from the high school locations to the area vocational-technical
training center locations.

This chapter is devoted to the development of the linear program-
ming model used to minimize the miles traveled per student. It consists
of describing the information necessary for developing the model used
for location of area vocational-technical training centers, the right
hand sides and their restrictions, and the activities composing the
various alternatives programmed and their matrix coefficients.

Linear Programming Model

Linear programming serves as the device to examine all the area vocational-technical training centers and district boundary alternatives. This programming model is a minimizing model [3].

The general minimizing model is:

$$\text{minimize} \qquad c = \sum_{j=1}^{n} c_j x_j$$

$$\text{subject to} \qquad \sum_{j=1}^{n} a_{ij} x_j \geq r_i \qquad (i = 1, 2, \ldots, m)$$

$$\text{and} \quad x_j \geq 0 \qquad (j = 1, 2, \ldots, n)$$

The c_j's in the objective function represent a set of given constants (student miles). The r_i represents the requirements composing the right hand side. The choice variables are denoted by x_j and are the level of activity of student transportation. The coefficients of the choice variables are denoted by the a_{ij} and are the matrix coefficients used, such as students, evaluation, etc. There are m constraints and n variables and $n \geq m$.

The average miles traveled by each student will be minimized. The right hand side values are the restrictions of each of the alternatives. Various right hand sides are programmed in order to achieve the minimim miles traveled per student and the minimum number of area vocational-technical training centers recommended to provide a state-wide system of area vocational-technical training centers.

Right Hand Side Development

The guidelines for establishing an area vocational-technical training center presently recommend that the proposed area school district shall have a total minimum scholastic population of 15,000 or serve a 50-mile radius from the proposed site of the school. The steering committee recommended that the 50-mile restriction be replaced with a 35-mile restriction.

Alternative Locations

Key locations were chosen as possible alternatives for locating area vocational-technical training centers and establishing district boundaries. Towns with secondary schools which have an enrollment greater than or equal to three hundred in the top six grades were considered. Some towns were eliminated if they were close to an existing area vocational-technical training center, or on an extreme border of Oklahoma. It was assumed that towns supporting a school enrollment of this size have the capability of providing the services needed by area vocational-technical training centers, such as fire protection, sewage system, and water. A listing of the alternative locations of area vocational-technical training centers is shown in Table I.

District Boundaries

Listing the alternative locations of possible vocational-technical training centers supplies a basis for determining district boundaries. This procedure necessitated tabulating the distance in miles from each independent school within the 35-mile radius to each

of the alternatives listed in Table I. The mileage was computed from
official highway maps of the State of Oklahoma and from Motor Freight
Mileage Tariff No. 1-c [7].

The area schools now existing are programmed in order to
reestablish their boundaries for a long-run plan. However, the location
of existing schools will not change.

Student Population

This study used the enrollment of the eleventh and twelfth
grades to determine the population of students available for training.
Based on the enrollment of the existing area vocational-technical
training centers, it was felt that these two grades would be sufficient
to provide the enrollment necessary for the establishment and main-
tenance of an area vocational-technical training center. Enrollment
of schools in Oklahoma was obtained from the State Department of
Education Statistical Department and reflects the 1968-69 school year
enrollment.

In this study the upper limit for the maximum number of students
is 10,000, and the lower limit is zero. These limits are imposed
only to facilitate the accounting procedure used in the linear program-
ming model. This program merely accumulates the eleventh and twelfth
grade students. A particular maximum and minimum number of students
can be obtained by placing the desired restrictions in the right
hand sides. The method of accounting was chosen because it allowed
the formation of area vocational-technical training centers without
the chance of getting an infeasible solution as a result of not
meeting the minimum number of students denoted by the restriction.
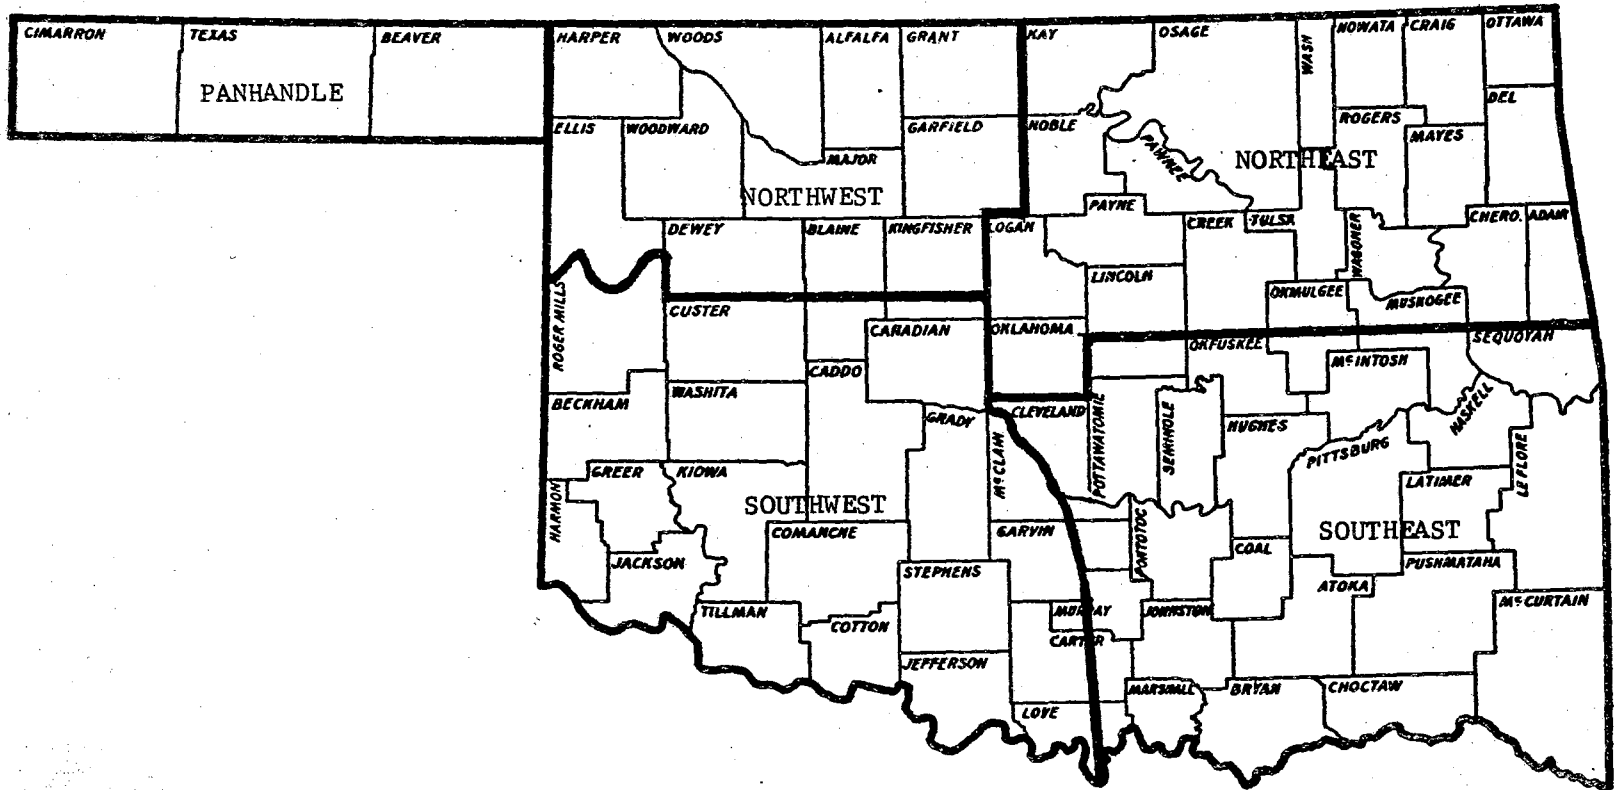

Figure 1. Five Sections of Oklahoma Used in Locating Area Vocational-Technical Training Centers.

Evaluation

The guideline also recommended that a minimum net assessed evalu-
ation of $40,000,000 after homestead exemptions be imposed on area
vocational-technical districts. This study adopted the recommendation
and used the evaluation of independent school districts. The evalu-
ation of independent school districts for the year of 1969 was acquired
from the Oklahoma Tax Commission.

Matrix Development

In order to make the study feasible, the State of Oklahoma was
divided into sections as illustrated in Figure 1. The divisions
necessitated overlapping the sections so that the independent schools
near the intersections could go in either direction. This did not
create a problem since the independent schools can be assigned to
the area vocational-technical training center that minimizes the miles
traveled by their student population.

All the possible combinations of alternatives for their respective
section were programmed. These combinations of alternatives appear in
the program as different right hand sides. (Table II serves as an
example of how each of these right hand sides was constructed.)

The matrix presented in Table II is a condensed version of the
tableau used in considering all the possible combinations of alter-
native vocational-technical training centers. This represents only a
sample of the expanded model used in this study.

The restrictions to be imposed on the combination of area
vocational-technical training centers being considered for locations
are listed in Column 1 of Table II. It also lists the independent

school districts that are considered in the combination composing each
of the various right hand sides. Columns 2 through 9 contain the
independent school districts being considered, the area vocational-
technical training center to which they may be affilitated, the miles
from the independent high school to the center, and the matrix
coefficients associated with each independent school. The inequality
symbols are given in column 10, and are associated with the restrictions
appearing in column 11. The maximum number of students in this program
was set at 10,000 and the minimum number at zero. The minimum valu-
ation used is $40,000,000. In isolated instances this restriction had
to be relaxed in order to obtain a feasible solution. The total
eleventh and twelfth grade enrollments composed the total students
for each respective high school.

This information was placed in the linear programming model and
all the possible combinations of alternatives that appeared feasible
were programmed. While the computer was considering one set of
alternatives, the restrictions in the other alternative right hand
sides were set at zero so that they were not considered. The optimum
locations of area vocational-technical training centers for the State
of Oklahoma are presented in Chapter III.

CHAPTER III

Optimum State-wide System of Area Vocational-
Technical Training Centers

The optimum locations of area vocational-technical training

centers were programmed on the assumption that the area centers

already established would not be allowed to change locations. The

area vocational-technical training centers already established are

signified by an asterisk in Tables III, VIII, XXII, and XXXI. The

optimum area vocational-technical training centers are presented in

this chapter according to the sections in which they were programmed.

Northwest Section

In this section of Oklahoma there were only a few alternatives to

consider as possible training center locations. These locations are

listed in Table III. There may be other towns in this area large

enough to provide the necessary services for an area training center,

but they lack the student enrollment to establish a center. Alva,

Enid, Fairview, and Woodward are the optimum area vocational-technical

training centers for this section of the state. Data on these centers

are contained in Tables IV through VII.

These tables provide (1) the area vocational-technical training

center location, (2) the valuation of the formed district, (3) the

total enrollment of the eleventh and twelfth grade student population

is eligible to attend the area vocational-technical districts, (4) the average miles traveled one way by the students from their respective high school location to the area vocational-technical training center, and (5) the independent school district, their junior and senior enrollment, and the distance from the training center.

The average one way miles traveled per student was derived by calculating the distance from a particular high school location to the area vocational-technical training center and multiplying by the number of eleventh and twelfth grade students enrolled in the high school. The student miles were accumulated and divided by the total number of students.

Certain independent school districts were unable to find an area vocational-technical training center within the 35-mile range used in the programs. Whenever this occurred, these independent districts were assigned to the area vocational-technical training center nearest them.

Northeast Section

This section of Oklahoma represents the most densely populated area. Shown in Table VIII are the various towns considered as possible area vocational-technical training center locations. Additional training centers were also recommended for Tulsa and Oklahoma City. Combinations of these alternatives were programmed and Bartlesville, Drumright, John Marshall (Oklahoma City), McLain (Tulsa), Miami, Midwest City, Muskogee, Oklahoma City Area Vocational-Technical Center, Pawnee, Ponca City, Pryor, Stilwell, and Tulsa Area Vocational-Technical Center are the thirteen sites that compose the optimum location of area vocational-technical training centers and are illustrated in Tables IX through XXI.

*These schools are a part of the Tulsa School System and are not
independent school districts.

Whenever possible the existing area vocational-technical training centers were expanded. Stilwell area vocational-technical training center, Table XX, is actually an addition to the program in the form of locating a satellite training center for the Muskogee Area Vocational-Technical Training Center. It may be noted that the satellite training center would provide a total junior and senior enrollment of 1,728 students. However, the accumulated valuation of the independent districts composing this location is only $17,415,138. Attaching to the Muskogee center will allow many students to receive training who otherwise will not have the opportunity because the valuation will not allow the establishment of an area vocational-technical training center.

The valuation for the area vocational-technical training centers located in Oklahoma City and Tulsa was derived by the following procedure: (1) The total valuation was obtained for each of the two school systems. (2) The total eleventh and twelfth grade enrollment was secured for each high school within the two school systems. (3) The total eleventh and twelfth grade enrollment was divided into the total valuation for each of the two school systems to determine the per pupil valuation used in the programming model.

Southeast Section

The extreme southeast section of the state presents problems in both the mileage and valuation restrictions. A satellite combination already exists in this portion of the state. In addition to McAlester, Hugo, and Poteau, one other school would need to be considered in order to complete the satellite combination and make a school available to

high school students and adults within a reasonable distance. Table
XXII contains the various possible locations of area vocational-
technical training centers for the southeast section.

Ada, Broken Bow, Durant, Henryetta, Hugo, McAlester, Poteau, and
Shawnee are the sites selected for this area of the state. Tables
XXIII through XXX contain the optimum locations of area vocational-
technical training centers for this section.

The valuation restriction was relaxed to find the optimum location
of satellite training centers for the extreme southeast portion of
Oklahoma. Broken Bow, Table XXIV; Hugo, Table XXVII; McAlester,
Table XXVIII; and Poteau, Table XXIX; are recommended as one area
vocational-technical training district. This combination of satellite
training centers will accumulate a total valuation in excess of the
$40,000,000 minimum necessary for the establishment of a vocational-
technical training district. Other area vocational-technical training
centers in this section were able to meet the minimum restrictions
imposed on establishment of area vocational-technical districts.

Southwest Section

Southwestern Oklahoma already has several area vocational-
technical districts established. Table XXXI is a list of the existing
and alternative locations considered in this section.

The optimum training center locations are Altus, Ardmore, Burns
Flat, Duncan, Fort Cobb, El Reno, Lawton, and Wayne. Data on these
centers are presented in Tables XXXII through XXXIX.

The information contained in these tables should provide insight
for independent school districts wishing to become part of an area

vocational-technical training district. With the exception of isolated independent school districts, all the restrictions imposed on locating a center were met by the area vocational-technical training centers composing the optimum solutions for this area of the state.

Panhandle Section

In discussing the formation of area vocational-technical training centers for the Panhandle section of the state the steering committee recommended that one training center be established. This center is located at Guymon and presented in Table XL. The sparse population of this area makes it difficult to establish a training center within the limits of the restrictions imposed on the program. The 35-mile range was extended to a 50-mile range in locating an area vocational-technical training center for this section. Even with this extended mileage five independent school districts were unable to become a part of a vocational-technical training center in the listing of the optimum locations. These isolated districts do have access to area vocational-technical training centers, but will have to travel farther than 50 miles to reach a center. This section is so thinly populated that it is not feasible to establish a satellite training center.

Summary of Optimum Locations

In some of the tables presented in this chapter certain independent districts may be found that are closer to another vocational-technical training center but are not listed under that location. This occurred in order to satisfy the $40,000,000 minimum valuation placed on the formation of an area vocational-technical district. Figure 2 is a

Figure 2. Area Vocational-Technical Training Center Locations and Boundaries.

diagram of the optimum locations composing the state-wide system of area vocational-technical training centers.

Table XLI consists of a list of the thirty-four area vocational-technical training centers, their valuation, total eleventh and twelfth grade enrollments, and the average student miles traveled to the area training center location. The thirty-four area vocational-technical training centers do not represent the recommended area vocational-technical training districts.

Consideration has been given to the districts already approved by the State Department of Vocational Education; the area center locations that do not or barely meet the minimum valuation requirements; and to the Tulsa and Oklahoma City independent school districts, which contain more than one area vocational-technical training center. This information provides the basis for proposing twenty-six area vocational-technical training districts. These districts and the location of the area vocational-technical training centers within each respective district for the State of Oklahoma are shown in Figure 3.

CHAPTER IV

Summary and Conclusion

This chapter consists of (1) a summary, which identifies the problems and describes how the objectives were fulfilled; (2) conclusion based on the research obtained; and (3) a discussion of areas for further research suggested in the course of this study.

Summary

The purpose of this study, as stated in Chapter I, was to determine the optimum location of area vocational-technical training centers to form a state-wide system of training centers for the State of Oklahoma. Information presented by the State Director of Vocational-Technical Education for Oklahoma and his supervisory staff for area vocational-technical training centers was instrumental in developing the criteria utilized by the programming technique. In addition the State Department of Education, the Statistical Department, the Finance Department, and the Oklahoma Tax Commission were very helpful in supplying needed information.

The information utilized for programming the alternative locations of area vocational-technical training centers is discussed in Chapter II. The results obtained from programming the alternative locations are presented in Chapter III.

The objectives of this thesis were (1) to develop a linear programming model for state-wide planning of area vocational-technical training centers; (2) to determine the district boundaries for future area vocational-technical training centers; (3) to establish boundaries for existing area vocational-technical training centers; (4) to make available to every student and adult an area vocational-technical training center; and (5) to determine the minimum number of area vocational-technical training centers to adequately serve the State of Oklahoma.

The State of Oklahoma was divided into sections to facilitate programming. Restrictions were imposed on the formation of a vocational-technical training district. These restrictions were as follows: (1) a maximum of 10,000 students for a given area training center; (2) a minimum set at zero for the number of students attending a center; (3) a minimum evaluation of $40,000,000 for a training district; and (4) a proximity of a 35-mile radius, except in the case of isolated independent districts. These restrictions are discussed in Chapters II and III.

A total of thirty-four area vocational-technical training centers are recommended for the State of Oklahoma. These centers are listed in Table XLI with their respective valuations, the total eleventh and twelfth grade enrollments in the proposed centers, and the average one-way miles traveled per student. A more detailed breakdown of data regarding the independent school districts that compose these centers is presented in individual tables in Chapter III.

From the thirty-four area vocational-technical training center locations, twenty-six area vocational-technical training districts were proposed and are outlined in Figure 3 in Chapter III.

Conclusions

The state-wide system of area vocational-technical training centers can be used effectively by persons or agencies planning area vocational-technical training centers. The procedure for locating training centers in this thesis can be applied to the optimum location of any service organization.

The linear programming model was allowed to choose the locations that would minimize the average miles traveled per student. This allows alternatives to be considered and decisions made from the results obtained while complying with the restrictions imposed.

Attention should be directed to the fact that this study was based upon programming around the existing area vocational-technical training centers. The optimum location of area vocational-technical training centers might have been different than this study reveals if this condition had not existed. However, the investment already existing in the established centers necessitated their being protected. The use of this study should prevent inaccessible pockets and help independent school districts, not a part of a vocational-technical training district, attach to an existing district.

Planners of area vocational-technical training centers should give serious study to (1) where a district should be formed and (2) where an independent school district may join an existing district. The establishment of these training centers should be viewed from a long-range

outlook, rather than from an immediate, short run, and isolated outlook. This would allow formation of centers which would eliminate the problem of independent school districts from being unable to adjoin an existing area vocational-technical training center; and would, at the same time, decrease the number of area training centers necessary to adequately serve the population of the state.

Need for Further Study

This study was based on the information persons involved in planning area vocational-technical training centers assumed to be necessary. There are many areas that need to be examined in order to form a more sound basis for these assumptions.

An area vocational-technical training center can be optimum from many points of view. This study dealt with optimally locating a center by minimizing the miles traveled per student within the boundaries of the previously listed restrictions. If a center is to be truly optimum it is necessary to include many more factors in order for this to be accomplished. The following areas are considered as major areas of research and could have been incorporated into the linear programming model if they had been available.

Before planning these optimum locations it would have been very useful to have known the optimum size of an area vocational-technical training center from both an economic and social standpoint. A study is recommended to determine the optimum size of an area vocational-technical training center.

Adult education is becoming a very important aspect in the field of vocational education. The adult enrollment already exceeds the

secondary school enrollment in Oklahoma area vocational-technical training centers. Some method needs to be determined to provide for the inclusion of adults in the population of persons to receive training. This area merits further examination and needs to be incorporated into guidelines for the establishment of training centers.

A study needs to be conducted to determine an equitable financing arrangement between the local, state, and federal agencies involved. This study should possibly go a step further and investigate the possibility of industries sharing in financing training centers.

There are many areas within the internal structure of area vocational-technical training centers that need investigation. The physical plant itself should provide flexibility for different training programs to be offered. Study needs to be directed toward equipping area vocational-technical training centers. All phases of securing equipment need to be investigated in order to be able to change vocational training offerings within a training center. A particular effort should be made to check leasing of equipment versus buying of equipment. If leasing of equipment could be accomplished, it may be possible to decrease the fixed costs and allow for a more rapid change of programs whenever graduates from particular programs have ceased to find employment.

Costs and benefits of vocational course offerings is another area where little information is available. If this kind of information were available it would assist administrators of area vocational-technical training centers in the setting of priorities for programs.

Another area closely associated with this is cost effectiveness of vocational education. Little information is available pertaining to this subject.

There are many areas in vocational education that merit research investigation. Area vocational-technical training centers are relatively new approaches to providing vocational training to secondary students and adults. These centers may eventually serve as agencies offering vocational educational training to secondary students, post-secondary students, and adults. Much research needs to be directed toward the area vocational-technical training centers to improve the vocational training offered and the quality of education persons attending these centers receive.

Candidate for the Degree of

Doctor of Education

Thesis: STATE-WIDE SYSTEM OF AREA VOCATIONAL-TECHNICAL
         TRAINING CENTERS FOR OKLAHOMA

Major Field: Agricultural Education

Biographical:

    Personal Data: Born in Eufaula, Oklahoma, May 23, 1934,
        the son of Lonnie J. and Wynoma Hopkins.

    Education: Graduated from Morris High School, Morris,
        Oklahoma, May, 1952; attended Connors State
        Agricultural Junior College, Warner, Oklahoma,
        1952-54; received Bachelor of Science Degree
        in Agricultural Education from Oklahoma State
        University in May, 1960; received Master of
        Science degree in Agricultural Economics from
        Oklahoma State University in May, 1969; completed
        the requirements for the Doctor of Education
        degree in May 1970.

    Professional Experience: Served with the United States
        Air Force, September, 1954, until September, 1958;
        Instructor of Vocational Agriculture at Delaware
        and Morris, Oklahoma, July, 1960, until September,
        1966; Research Assistant, Oklahoma State University,
        Stillwater, Oklahoma, from September, 1966, until
        September, 1969.
