PREFACE

Basic to the tenets of our democratic society is the ideal of educational opportunity for all through the publicly supported school system. While mounting evidence indicates numerous important changes, this long accepted principle maintains a continuous priority in American tradition. Educational programs, organizational structure and financial policies have changed greatly during the past decade. Considerable progress has been made, however, in adapting education to the needs of society. In recent years economists have suggested that education warrants increased attention and consideration in the public sector. No one denies that good schools are essential to the national welfare. Few disagree that the most important resource of the United States is its citizens. The financial support of public education is one of the most pervasive problems of government. Local boards of education and state legislatures find themselves increasingly involved with questions pertaining to funds for public education.

The direct relationship between the funding of school finance formulas and the quality of education must be articulated to those in the political decision making positions. Improvements are needed in incentive aid programs to overcome

existing weaknesses and to demonstrate the advantages of flexibility.

The Kansas public schools at present face a serious financial crisis. Sanctions have been imposed by the NEA and KSTA. Kansas educators and politicians cannot avoid engagement with the struggle to meet demands of a changing environment, or the involvement of issues for financial support of public schools.

The present foundation plan for school finance in Kansas was adopted in 1965. Although that plan is an improvement over past finance plans, there still remain unsolved problems. The most controversial issues in public school finance are: the source of the revenue needed, the method of distributing the state funds, and the establishment of acceptable practices to identify quality education.

It is hoped that this study will offer a new approach for distributing state funds to local school districts and will create an incentive for local districts to work toward optimum efficiency with maximum effort.

The purpose of this study is twofold. First, the writer plans to develop a defensible foundation program that will assure equalization in distributing state funds to Kansas schools. The second purpose is to reinforce and supplement the knowledge now possessed by legislators, educators, and interest groups relative to the theory of equalization and educational opportunity. The writer will cite new revenue sources not only to fund the foundation

program but to give relief to overburdened school districts.

The successful completion of this study is due to support given the writer by his Advisory Committee, the Kansas Association of School Administrators, the Kansas State Department of Education, the Kansas State Teachers Association, the Kansas Association of School Boards, and a number of individuals who made special contributions.

Sincere appreciation is expressed to my Committee, Dr. Richard Jungers, Chairman, who co-authored the foundation proposal for the Oklahoma Education Association, Dr. Kenneth St. Clair, Dr. James Appleberry, and Dr. Ansel Sharp. Special gratitude is extended to Senator Joe Harder, Chairman of the Joint Legislative Finance Committee, and Damon Weber of the National Education Association, who provided special assistance for the project. Indebtedness is acknowledged to members of my staff who were always diligent, cooperative, considerate, and helpful. Finally, I am very grateful to my wife, Lois, for her confidence and understanding, and above all, her patience during the development of this project.

CHAPTER I

INTRODUCTION

Public education in the United States is provided through the cooperative actions of the federal, state and local governments. Although each of the three levels of governments has responsibilities for public education, the primary responsibility rests with the state government.¹

State policy for public education is set by the legislature of each state and may be designed to include a wide range of purposes. Jarvis, Gentry, and Stephens list primary purposes for state support in public education as:

1. Social benefit
2. Equalization of educational opportunity
3. Equalization of tax burden
4. Stimulation of local expenditures
5. Distribution of costs among different tax sources
6. State control²

School requirements have risen steadily in recent years. This in turn has created a need for greater understanding on the part of all citizens to provide greater support for public education. It is therefore necessary to suggest or

¹Robert L. Drury and Kenneth Ray, Principles of School Law (New York, 1965), pp. 2-21.

²Oscar Jarvis, Harold Gentry, and Lester Stephens, Public School Business Administration and Finances (West Nyack, New York, 1967), pp. 44-46.

create and explain financial programs which not only provide greater support but which also are accepted by the legislature and educators. Demands for increased funding result from increasing enrollments, rising standards of living, and changing programs within the school system.

Politically powerful groups in Kansas have had considerable effect on school finance. Power groups enact or defeat legislation which is urgently needed to solve educational finance problems. Burkhead has observed:

Education is one of the most thoroughly political enterprises in American life--or for that matter in the study of society.³

When power groups understand educational proposals, they can make an impact on legislators. When constructive programs are presented and explained to the many power groups, legislative action reflects this orientation. Elwood Cubberly states:

The first important step in the provision of educational advantages for the children of the state has been taken when the people of that state come to recognize a broad and general responsibility for the education of all the children of the state, rather than proportions of them here and there. This recognition of responsibility is evidenced by the establishment of large area taxing units and a wide pooling of maintenance costs. These marked attempts to equalize, to some important degree, the burdens of support for which is conceived to be for the common goal of all.⁴

³Jesse Burkhead, Public School Finance, Economics and Politics (Syracuse, New York, 1964), p. 93.

⁴Elwood P. Cubberley, State School Administration (Boston, 1927), p. 450.

Although the three levels of government are interested in public schools and involved in their financing, the responsibility for the direct administration and supervision of the public schools is vested in the local school district.⁵ The American three level financing of public schools is more complicated than one finds in countries providing for the finance, administration, and control of the public schools by central governments. A further complication is that school boards have only the power to obtain and use local funds for schools as granted to them legislatively and constitutionally. Decisions regarding financial support in local school systems are political. In most local school districts the school board is elected by the non-partisan popular vote, and in the others it is appointed by politically elected officials.⁶ Therefore, while schools are presumably removed from partisan political control, all basic policies are subject to political considerations.

"America's public schools are in deep and growing trouble with the taxpayer."⁷ This statement is supported by research from U. S. News and World Report on the outcome of school bond elections from 1965 through 1969. During this

⁵Roe Johns and Edgar Morphet, Financing the Public Schools (New Jersey, 1960), p. 197.

⁷U. S. News and World Report, October 20, 1969, pp. 36-37.

period the success of 2,041 bond elections with 516 rejections in 1965 has changed to 1,341 successful bond issues and 579 rejections in 1969. The percentage of rejection has increased from 25 percent to 43 percent. In the years following World War II, a "baby boom" and the mobility of population forced taxpayers to spend lavishly on new buildings and increase teaching staffs as enrollments soared. In 1950 the national expenditure for public schools of \$5.8 billion represented an increase of 150 percent over school spending ten years earlier. During the decade beginning with 1950, the annual costs tripled to \$15.6 billion. The year 1965-66, when declining birth rates brought the first signs of lessening future enrollment, required spending for public schools of \$26.2 billion. Although current elementary school enrollments show some decline, the total educational expenditure (K-12) at present is approaching \$30 billion and is expected to pass \$40 billion by 1975, despite anticipated lower high school enrollments.

Educators provide a variety of explanations for the increased costs. Inflation is adding heavily to the operational costs each year. Pressure grows to provide more and more compensatory education for children of the economically and culturally deprived, especially in the large urban cities. Innovative programs ranging from educational television, programmed learning, and computerized instructions affect the budgetary needs.

Even though all decisions regarding support for education cannot be removed from the political realm, Nicholas DeWitt calls attention to some recent developments that help provide a more objective basis and sounder rationale for increased financial support to education. These include:

1. An increasing recognition by economists that education has considerable economic value as shown by recent studies.
2. Strong evidence from research studies that under appropriate conditions there is a relationship between costs and quality of education.
3. The development through research of basis and procedures for apportioning funds that will make possible equality of educational opportunity.⁸

Nature of the Problem

According to Kansas legislators and power groups, Kansas school districts are in a serious financial difficulty. There is consensus among political and educational leaders that a major revision of the state financial policies is necessary to continue development of education for Kansas children and to provide equity in tax support. The foundation plan of 1965 was adopted because of general acceptance of the principle of increased state responsibility for the financial support of education. The distribution formula, however, is difficult to understand and has failed to produce equality of educational opportunity or reasonable tax equity. The five years of operation under restraints of the present

⁸Nicholas DeWitt, "Investment in Education and Economic Development," Phi Delta Kappan, December, 1965, pp. 193-196.

foundation program have contributed to the complex state of financial problems. Urgent attention and study of new plans is needed to improve the programs for financing Kansas schools.

Purpose of the Study

The purpose of this study is to collect information from research and authoritative sources and develop a desirable and workable distribution formula for financial assistance for elementary and secondary schools in Kansas.

The writer identifies three important questions for study:

1. What are the criteria for determining elements of a satisfactory foundation program?
2. How well do each of the present elements within the present Kansas school finance structure meet the requirements of foundation theory?
3. What revisions or improvements can be made in the present distribution formula to gain consensus among all interested power groups?

Burdick, in his dissertation at Oklahoma State University, "A Distribution Program for State Support of Current Expenses," lists four questions for research purposes that need to be considered for this project.

1. What are some specific school finance principles widely acceptable that can guide the proposed investigation?
2. What does current school finance theory suggest about the state financial structure for public education?
3. What does the best from current practice and the recommendations of school finance authorities

concerning distribution formulas suggest about possible alternatives for a desirable program?

4. What recommendations can be made for the school finance structure for the next five years?⁹

Background Information

Kansas is often characterized as a sparsely populated rural flatland where cattle graze and wheat flourishes, however, more than sixty percent of its 2,250,000 people are concentrated in urban centers of Kansas City, Topeka, and Wichita.¹⁰ Although the state's economy is still basically agrarian in most areas, the development of the oil industry, other natural resources, and industry give a balanced diversity to the economy.

A look at state history reveals that funds for education have never been easy to secure at the state level, however, recent efforts have been made to increase state aid. The 1965 session of the Kansas Legislature was labeled a memorable one by the Kansas-NEA, Kansas Association of School Boards, National Congress of Parents and Teachers, Kansas Association of School Administrators, and other interested groups.¹¹ Several major proposals were written into law to improve

⁹Larry Burdick, "A Distribution Program for State Support of Current Expense for Public Education in Oklahoma" (dissertation, Oklahoma State University, 1967), p. 8.

¹⁰National Education Association and Kansas-NEA, A State-wide Study of Educational Conditions and Financial Support (Topeka, Kansas, January, 1968), p. 112.

¹¹Ibid.

education within the state. One of these was the Kansas Foundation Act which provides the state-shared guarantee of state aid to supplement funds from local districts and counties. Before deductions are made, the state-shared guarantee is based entirely upon the total number of college hours and years of teaching experience for all certified personnel in the district. The element arrived at by combining experience and professional training of the teachers is multiplied by \$760. The state-shared guarantee is a result of this computation provided that the ratio of pupils per teacher is properly maintained to comply with the state guideline. Local effort, contributions and penalties make up the deductions that are subtracted from the guarantee. The allocation for state aid has remained basically the same since 1965, while the cost of education per pupil has risen twelve percent during the past two years.¹² The ad valorem tax was eased in 1965, but is now at the point of reaching an all time high.¹³

Specific Goals for Improvement
of School Finance in Kansas

Recent surveys by various power groups in Kansas reveal that there is a desire for continued and improved support for educational opportunities. There are three desirable changes which could restructure the present foundation program to make it a more satisfactory solution for all concerned with the future of education in Kansas.

¹²Ibid.

¹³Kansas Government Journal, "State and Local Government Tax Levies" (April, 1969), p. 156, ed. E. H. Moser.

1. In order to compensate for inflationary costs in all phases of education, more funds should be allocated to the foundation program.
2. Financing the foundation program must be through a new tax structure to enable the state to assume a larger role in support of public schools without relying on present overburdened tax sources.
3. The most controversial part of the present foundation plan is the distribution formula. The present formula and all proposed formulas fail to satisfy a majority of Kansas school districts. There must be a new formula with a different system of variables in order to achieve equalization.¹⁴

The paradox is, however, that with no new acceptable plan to be implemented, the present one must remain in operation.

The writer recognizes that the major problem facing any of the new proposals which strive to improve the "school foundation act" is the lack of cooperation and consensus among powerful interest groups. All of these groups agree that changes to the present program are needed but how the changes come about and which elements are to be affected by the change are real sources of controversy.

In order to develop a defensible school finance plan, it is imperative that the elements supported by the majority of people are identified. The writer's first step toward the development of a new school finance plan was to make personal contact with presidents or executive secretaries of five major organizations. Arrangements were made to survey

¹⁴Report of the Kansas Association of School Boards, Committee on School Finance to the KASB Delegate Assembly, January 18, 1970.

each of the organizations' board members. The questionnaire included in Appendix B was mailed to each of the 71 members. The principle response to the questionnaire was developed from the characteristics of a desirable foundation program as listed by Edgar L. Morphet, Roe L. Johns and Theodore L. Reller.¹⁵ The mean response to each principle is illustrated in Appendix D.

From the results of the survey, a set of principles has been developed which will be used as a basis and guide for the establishment of a new school finance plan and distribution formula. The principles are as follows:

1. Financial support of public education should be a joint partnership of the local government, state government, and federal government.

It is imperative that the federal government increase its participation in support for public education but continue its role as a junior partner.

2. The State of Kansas must assume a greater responsibility for the support of public education. All unified school districts other than the extremely rich districts should receive a minimum of 50 percent state support for the operation during a fiscal school year. Local boards of education should be free of unreasonable restrictions in the administration of fiscal affairs and from undue controls by state agencies. When school boards are hampered in the

¹⁵Johns, Morphet, and Reller, p. 512.

exercise of their judgment to solve the great variety of problems facing them, the education of children suffers.

3. The measure of the local school district's ability to pay should be in terms relative to both the property tax base and the local economic index of personal income. Consideration must be given to the school districts in high income areas which have a low assessed valuation and to those school districts with a high assessed valuation and limited personal income.

4. Boards of education should continue to be fiscally independent of other governmental bodies, but in order to maintain continued community interest required to further qualify education at the local level, each district's guaranteed share will be established in relation to a local levy of 10 mills. This levy, however, should not be compulsory. As a local incentive the district should be permitted to increase the levy an additional 5 mills without a referendum of the people. For districts that exert extra effort to improve the quality of education there should be matching funds from the state prorated on a percentage equalizing basis. Incentive programs should be approved by the State Board of Education.

5. The amount of state support given to the public schools should be based on the per capita income within the State of Kansas in relationship to the national per capita income and national average of state support for public schools.

A study by Benson¹⁶ reveals that 41 of the 50 states fall within a pattern of \$75 above or below a relationship between the state's per pupil support and per capita income. Figure 1 illustrates this correlation.

Figure 1. Relation Between State Personal Income and Public School Expenditures, 1966.

Source: Charles S. Benson, The Economics of Public Education, Figure VIII, p. 196.

6. There should be an inverse relationship between the amount of state aid received and the school district's assessed valuation per pupil relative to the state mean assessed per pupil valuation.

7. The variables for the distribution formula to be given attention are:

¹⁶Charles S. Benson, Perspectives on the Economics of Education (Boston, 1963), p. 274.

- (1) Ability to pay (property tax)
- (2) Local economic index (personal income)
- (3) Size of school
- (4) Professional training and experience of teachers
- (5) Pupil teacher ratio

Variables to be used in the new formula are:

(1) Economic index. The present formula provides an economic index at the county level. The economic index in the new formula would be operational within school district boundaries with a variable for taxable income per pupil in public schools.

(2) Local ability to pay. It is the consensus of the Kansas-NEA, Kansas Association of School Boards, State Department Board of Directors, that the inclusion of the variable on property tax base is imperative. The statewide median assessed valuation per pupil within school districts is \$8,500. The range, however, is from \$3,000 to \$106,000. A variable should be implemented within the formula in order that poor districts are not overburdened in offering the same quality of education as richer districts.

(3) School enrollments. Statistics from the Kansas State Department of Education reveal that the larger school districts may operate on a lower cost per pupil than the extremely small districts. Therefore, a variable is needed within the formula to compensate for extra expenses of operating the less populated school districts in large sparsely populated areas.¹⁷

¹⁷ Report of the Kansas Association of School Boards, Committee on School Finance to the KASB Delegate Assembly, January 18, 1970.

(4) Professional training and experience of teachers.

There is a variable for this purpose in the present formula which should be retained to encourage boards of education to employ professionally trained staffs. However, simplification of the administration and record keeping of professional hours and experience of each staff member is needed. Computer programming and innovations for file systems offer an opportunity to save countless hours in the administration of this portion of the formula.

(5) Pupil teacher ratio. This variable is also contained in the present distribution formula and should be retained to encourage boards of education to continue the quest for quality education. It serves as a stabilizer which assesses a penalty upon districts employing too many or too few teachers. Guidelines are provided in the foundation program which list maximum and minimum pupil teacher ratio requirements relative to school enrollments.

8. Transportation costs and sparsity factors should be excluded from the foundation formula. Research by the Kansas Association of School Boards and the Kansas State Department of Education reveals that it matters not whether transportation costs are included or excluded from the foundation formula.¹⁸ Since transportation problems vary so much from district to district, transportation can be a separate item

¹⁸Ibid.

for state aid and need not be included in the actual distribution formula.¹⁹

9. Budget capacity should be pre-planned in each district with regard to projected enrollment. Official enrollment count will be based on semi-annual enrollment figures. Small error in projection should be permitted before districts are penalized. Addition or deletion from state aid in successive years can serve as a procedure for correcting official membership.

10. The foundation plan should be financed by a "good" tax. Sharp and Sliger in their book, Public Finance, give three principles of a "good" tax:

- (1) Equity
- (2) Efficiency
- (3) Adequacy²⁰

11. The foundation plan should provide funds for capital outlay and school textbooks. Kansas statutes call for free education.²¹ Most school systems in Kansas now operate on a textbook rental program which places a financial burden on large families with low income. Capital outlay expenditures are permitted by a four mill special levy but are not supplemented by state funds.

12. School districts eligible for state support should have a minimum school enrollment of 150 (K-12).

¹⁹Arvid Burke, Financing Public Schools in the United States (New York, 1957), p. 146.

²⁰Ansel Sharp and Bernard Sliger, Public Finance (Homewood, Illinois, 1964), p. 196.

²¹Kans. State Dept. of Educ., 1968 School Laws of Kansas, Topeka, Kansas, KSA 72-4154, p. 454.

Procedure of the Study

Using the twelve stated principles as a basic guide, the report will have four parts. The first part will consist of a review of literature relative to school finance and related issues. The second part will consist of an evaluation of each variable of the present distribution formula in relation to the principles. The third part consists of a development of a distribution formula which will be operationalized for all school districts of Kansas. The final part consists of an evaluation of the plan with the principles serving as criteria along with recommendations for legislative changes and future studies.

Limitations of the Study

1. An obstacle to the preparation of the project was lack of recent data. It was necessary to use 1969-70 statistics for a plan that would be implemented two years later. A time lapse of only one year is preferred.

2. One limitation was the lack of interaction desired with organizations and special interest groups. Opinions were expressed on the questionnaires without the opportunity to question or discuss the issues.

3. The change of political offices and leadership during the preparation of this project results in a change of philosophy toward school finance within the political domain.

4. The conflicting views of conservative groups, welfare organizations and special interest groups toward education

creates a difficult task to seek common goals for developing principles of a school foundation program.

5. The lack of understanding of equalization in educational opportunity has been a serious limitation. Indications are that the majority of citizens look to a foundation program for flat grants only.

Definition of Terms

Equalization: Corbally²¹ describes equalization as an attempt to use other than local funds to insure that each school district in a state will receive adequate financial support to enable it to provide a satisfactory educational program without requiring undue financial effort of those who by reason of circumstance reside in the school district with below average financial ability.

Pupil-Teacher Ratio (PTR): The ratio of the number of students enrolled in the district to that of the total number of certified employees in that district.

Local Ability: Local ability is defined as a quantitative measure of the resources available in a taxing jurisdiction within a local district to raise revenue for public purposes. Peterson lists three measures of ability: income, economic index, and property valuation.²²

²¹John Corbally, School Finance (Boston, 1967), p. 48.

²²LeRoy J. Peterson, Economic Impact of State Support Models on Educational Finance (Wisconsin, 1963), pp. 46-48.

Criteria of Quality (COQ): The criteria of quality comprises a variable in the form of an index number presently used in the Kansas foundation formula for distribution of funds to each school. It is computed as follows: (1) The number of college hours for all certificated personnel within the district (not to exceed 210 hours for each person) are added and the sum is divided by 30. (2) The number of years of experience for all certificated personnel (the limit of 15 each) are added and this sum is multiplied by .2. (3) The sum of the two numbers previously computed gives the criteria of quality for that particular school district.

Summary

Due to change in requirements, our schools face new problems of financial support reinforced by a greater problem of convincing the public of these needs. As in most states, the interested power groups in Kansas have had a considerable effect on school finance. The success of any school finance proposal is wholly dependent upon the ability to bring organizations and legislators together in a cooperative movement to support the program.

The increased percentage of school bond rejections during the past five years reflects the attitude of patrons toward increased school expenditures from local sources.

Kansas schools are in financial difficulty despite a foundation program implemented in 1965. While the allocation of state aid have remained basically the same since 1965, the cost of education has risen consistently. Property tax received one year of relief but has again soared to record levels. Not only is the present formula difficult to understand, but some groups feel that it produces neither equality of educational opportunity nor tax equity.

The purpose of this study is to evaluate the present formula and to develop a more satisfactory foundation plan for allocating state funds to the public schools of Kansas. Three important questions identified for the study are:

- (1) What are the criteria for determining elements of a satisfactory foundation program?
- (2) How well do each of the present elements within the present Kansas school finance

structure meet the requirements of foundation theory?

(3) What alternatives or improvements can be made through the present distribution formula to establish a congruence of objectives among the interested groups?

Specific goals in this program for improving public school finance in Kansas are: (1) Increasing the allocation of funds for a foundation program, (2) shifting of taxes to relieve overburdened areas and select a "good tax" for new revenue, and (3) development of a formula with a system of variables that will achieve equalization.

Recognition of the major problem of developing cooperation among power groups is essential before the development of a new school finance plan can begin. The first step in the procedure for preparing a suitable school finance plan was to achieve consensus on major elements of a distribution formula. This task was accomplished by surveying the board of directors of five major organizations. From the data received in questionnaire form, a set of twelve principles has been established to serve as criteria for developing a new foundation program and to evaluate the results of the formula when it becomes operational. The project consists of four parts: (1) review of literature relative to school finance and related issues, (2) an evaluation of the variables from the present distribution formula relative to the established principles, (3) development of a distribution formula and foundation program, and (4) evaluation of the foundation program and recommendations for legislative changes and future study.

CHAPTER II

A REVIEW OF SELECTED LITERATURE

The mounting evidence indicates clearly that important changes will need to be made in almost every aspect of education during the next few years.

Educators and responsible citizens cannot afford either to do the wrong thing or to neglect to do something that is needed if there is any way of avoiding such a mistake.

Fortunately, in many aspects of education, there are defensible theories and research findings that can provide some guidance.

By planning for the future, unfortunate developments can be avoided and advantageous accomplishments can be facilitated. On the basis of available evidence and by utilizing sound judgment it is possible to identify appropriate objectives and modify them. Alternate methods of achieving an objective should also be identified. An analysis of the inputs required and of the costs and benefits of each will usually be helpful in arriving at a decision as to which would be most advantageous.

Basic Issues

After studies of educational issues it is found that major problems needing consideration still exist as in these

questions asked by Johns and Morphet:

- (1) Is equality of educational opportunity practical and desirable?
- (2) Does a closer approach to equality mean greater centralization?
- (3) Should expenditures for all aspects of local government be considered in determining local ability to support schools?
- (4) What is the best measure of local ability?¹

Concepts of Education and Finance

Concepts regarding the financing of education vary among local school systems in each state and in the different states. There are more striking and significant similarities than differences. These similarities stem from a democratic government and the beliefs of its citizens regarding policies and procedures essential to its perpetuation. Among the pertinent concepts and beliefs generally held by citizens throughout the nation are:

- (1) Education should be provided for all through the elementary grades, for virtually all through the high school grades, for a large portion through junior college grades and for the most competent through the colleges and universities.
- (2) Everyone should have equality of opportunities for the kind and quality of educational program which will best meet his needs and those of the society in which he lives.
- (3) Public elementary and secondary schools should be entirely supported through public taxation; public institutions of higher learning should be largely supported by such funds; non-public schools and institutions of higher learning should be supported on a voluntary basis and not from tax funds.

¹Roe L. Johns and Edgar L. Morphet, The Economics and Financing of Education, (New Jersey: 1969), pp. 187-194.

- (4) Each state should provide through its constitution or laws, for adequate financial support of public schools and institutions of higher learning.
- (5) Each citizen in the state should contribute in accordance with his ability to the support of public schools and public institutions of higher learning in the state.
- (6) The resources of a nation should be used to assist in providing educational opportunities to children through public schools and institutions.²

Three differences in generally accepted objectives and common practices related to the educational program and its financial support are:

- (1) While many complete high school and a substantial percentage of these attend college, there are many who drop out before completing high school.
- (2) The educational program in many communities is inadequate. Appropriate educational opportunities are lacking due to insufficient funds, ineffective leadership, or a program that is not designed to meet the needs of many of the students.
- (3) Many citizens do not contribute to the support of public schools and institutions of higher learning in accordance with their abilities.³

Some of the reasons for the differences in what we believe and in what we do are:

- (1) Definition of concepts of purpose
- (2) Reliance on property taxes and outmoded practices
- (3) Inequities in local wealth and local ability to assume local responsibility

²Roe L. Johns and Edgar L. Morphet, Financing the Public Schools, (New Jersey, 1960), p. 4.

³Ibid., p. 7.

- (4) Continuation of antiquated districts
- (5) Weaknesses in leadership and management⁴

Issues in School Finance

Two basic questions recur directly or indirectly in most of the controversial discussions about school finance:

- (1) What should be accomplished through the public schools?
- (2) How much should the public school program cost and how should it be financed?⁵

Some feel that any reasonable quantity and quality of education can and should be financed. Others feel that taxes are too high and financial support must be limited, and conclude that the educational program provided must therefore be limited. It is much easier for most to see a relationship between quantity and cost of educational expenditures than between quality and cost.⁶ There are only a limited number of situations where increased quantity does not require increased expenditures if quality is to be maintained. In some schools a few students could be added to a certain class without increasing costs significantly. However, if the enrollment in the local state school system increases by ten percent, the cost probably would be increased by nearly the same proportion if quality is maintained. Many agree that increasing quality is apt to add to the cost but few would agree that increasing the cost would necessarily add to the

⁴Ibid., p. 8.

⁵Ibid., p. 11.

⁶Ibid., p. 12.

quality. There are some conditions under which there is not necessarily a relationship between cost and quality:

- (1) Small schools tend to cost more per pupil than larger size schools, even though the quality of education provided in the smaller schools is frequently found to be inferior to the larger schools.
- (2) The quality of education may be adversely affected by inept leadership and administration.
- (3) Some state laws or local board policies which may require the continuation of out-moded practices limit the quality of education provided.⁷

Educational Opportunity

The concept of educational opportunity is generally accepted but is not always practical. Its definition, however, should be understood to be opportunity for education for individual need through a multiplicity of programs.

Some of the differences in equality of educational opportunity are difficult to demonstrate. State averages do not show the extremes. Johns and Morphet cite a difficulty that emerges from this fact. Educational opportunities in the best school systems of some of the less affluent states may compare reasonably well with those in the best systems in other states.

The potential state expenditure for education and other governmental services is directly related to the income of its citizens. The expenditures for education on a state-wide basis seem to have a direct bearing on the quality of

⁷Ibid., p. 13.

education provided.⁸ With the great mobility of population at the present time it is evident that inadequate educational opportunities in a state not only handicap the people in that state but may constitute a problem for other states into which the migrants settle.

Research indicates that the range in educational opportunities within a given state is usually greater than the differences in the average of all the states. Many states, however, offer most children fairly adequate educational opportunities.

Equality of educational opportunity within most local school systems is greater than within states.¹⁰ There are variations in most school systems. It could be that children from homes in certain areas are more handicapped than those from other types of homes. School factors such as inferior buildings or schools where the less competent principals, teachers, or noncertified personnel have been assigned are also variables. It is the opinion of Johns and Morphet that too many systems have such schools in underprivileged areas where some of the background factors involved in inequity of opportunity are:

- (1) Many people do not realize the extent or implications of inequalities.

⁸Ibid., p. 141.

⁹Ibid., p. 143.

¹⁰Johns and Morphet, The Economics and Financing of Education, p. 171.

- (2) Some people have become accustomed to the existing situation and accept it as normal.
- (3) Substantial numbers of people seem to be more concerned about their own personal problems and the rising cost of living and of government than about variations in educational opportunity that do not seem to affect them immediately.
- (4) Until recent years the procedures needed to solve certain aspects of the problem had not been satisfactorily developed or understood.
- (5) There are wide differences among local school districts in wealth per pupil.¹¹

Need for Reorganization

Keith Goldhammer suggests a complete reorganization for operation of school systems and schools.¹²

There still exist many rural areas as well as urban and suburban districts where the provisions for education are inadequate. The definition of local responsibility and control needs to be reconsidered. One approach might determine in context, what kinds of educational decisions can be made best at the individual school level, at the state level, and at the national level, and also what kinds of organization will facilitate them.¹³

¹¹Ibid., pp. 172-173.

¹²Keith Goldhammer, "Local Programs for Education," Chapter II, Oregon State University.

¹³Ibid., p. 75.

Variations in Ability

The study of the problems in school finance shows that the citizens of a community must have the financial ability well above that required to provide the bare necessities before they can afford a program of education beyond that incidental to the learning required for survival.

In order to establish ability to pay for education, there must be agreement about the measures to be used. In the past the measure of the ability of the people in each state was assumed to be per capita wealth as represented by the value of property in the state.¹⁴ Property tax, however, as a source of state revenue is not adequate to bear the burden and does not measure wealth as equitably as does income.¹⁵ Reliable data are now provided periodically by government agencies regarding annual income payments of the citizens of each state. When the income of the people of each state is known it is possible to determine the average per capita income, the average income per child of school age, or the average income per pupil based on average daily membership or attendance. Johns and Morphet feel that personal income per child

¹⁴Johns and Morphet, p. 178

¹⁵Ibid.

of school age is a better measure than the personal income per pupil and the average daily attendance in public schools because all children in these age groups should be educated in some kind of school.¹⁶ Even when this is used as a measure, there are considerable differences in the ability of the respective states to support schools. The wealthiest state has between two and three times the ability to pay than does the poorest.¹⁷

In most states the variations among the districts in their ability to support schools are greater than those between the states.¹⁸ Recent studies in a number of states have indicated a range in ability in a county-unit and other large district states of from nine to one to about twenty-five to one.¹⁹ If no state aid were provided in these states, the poorer districts would have to make from nine to twenty-five times the effort made by the wealthiest to finance a program providing reasonable equality of educational opportunity. The following conclusions can be made from the previous studies:

- (1) In no state can the least wealthy districts finance a reasonably satisfactory program of education from local funds without an unreasonable tax effort, and in many districts, the effort required would be prohibitive.

¹⁶Ibid., p. 179.

¹⁷Ibid., p. 179.

¹⁸Ibid., p. 179.

¹⁹Ibid., p. 183.

- (2) The differences in wealth in small-district states are so great that no program of state aid is likely to solve all the problems until further reorganization occurs.
- (3) Until further progress is made in many states in improving district organization and provisions for financing schools, inequalities in educational opportunity are certain to continue. Substantial numbers of pupils in many states cannot expect to have even reasonably adequate educational opportunities under present conditions.²⁰

Current School Support Issues

At the close of the 1960's, financial support of schools was a great problem of governments at all levels.²¹ Not only have the costs of all government services increased but the birth rate has led to rapidly increasing school enrollments at all levels.²²

Percentage of financial contribution to education are 3.6 percent federal, 40.1 percent state, and 56.3 percent local.²³ While educators may argue that schools are still inadequately financed, the taxpayer is resisting tax increase. Data prepared by the Tax Foundation for 1958 reveal that all federal, state and local taxes in that year removed almost 24 percent of the personal income from taxpayers and even at the lowest income level (under \$2,000 per year), the personal tax bill represented 21 percent of the income.²⁴ The support

²⁰Ibid., p. 184.

²¹John E. Corbally, School Finance (Boston, 1967), p. 58.

²²Ibid.

²³Ibid.

²⁴Ibid.

of public schools is currently requiring funds which fall just short of reaching four percent of personal income, therefore, each wage earner contributes approximately one working day per month to provide funds for public education.²⁵ Corbally says additional study is needed to determine revenue sources of the several levels of government and how adequate they are.²⁶

State Taxes in 1968

Considering that 1968 was an election year for officers in state legislatures, the record of taxes enacted was labeled heavy.²⁷ The additional state revenue forced the consideration of tax legislation in nearly all of the 24 state legislatures which met in the regular session during 1968. The resulting tax activity produced a variety of increased taxes with particular emphasis on general and special excise taxes. These actions are estimated to add \$1.3 billion a year to state tax revenues.²⁸ Total revenues from state taxes have more than doubled since 1960.²⁹ In 1968, general revenue receipts increased to \$59.1 billion. This represents a 13.6 percent increase over 1967 receipts. The states'

²⁵ Ibid.

²⁶ Ibid., p. 59.

²⁸ Ibid.

²⁹ Ibid.

general expenditures, however, increased to \$60.4 billion, thereby resulting in a deficit.³⁰ Expenditures in 1968 increased by 13.3 percent over 1967. An expansion of state services particularly in education and public welfare contributed heavily to the deficit. Table I reflects state tax revenue impact between 1958 and 1968.

TABLE I
STATE TAX REVENUE, 1958-1968

Fiscal Year	Total Amount (millions)	Amount of Increase over Previous Year (millions)	Per-Capita Amount	Amount per \$1,000 of Personal Income
1	2	3	4	5
1958	\$14,919	\$ 388	\$ 86.50	\$41.98
1959	15,848	929	90.18	41.95
1960	18,036	2,188	100.64	45.46
1961	19,057	1,021	104.60	46.19
1962	20,561	1,504	112.81	49.83
1963	22,117	1,556	117.76	50.56
1964	24,243	2,126	127.24	52.82
1965	26,127	1,884	135.36	53.52
1966	29,388	3,261	150.60	55.52
1967	31,929	2,541	162.01	55.31
1968	36,414	4,485	182.94	58.57

Source--Table 1: State Taxes in 1968, July 1969, National Education Association Research Division, p. 1.

³⁰Ibid., p. 2.

Property tax revenue continues to carry the burden for new school revenue.³¹ The 1968 state revenues are exceeding those of new local revenues of the preceding year. State expenditures for education during 1968 increased 14.4 percent reaching a total of \$24.3 billion.³² Table II shows the state collections by types of taxes, from 1967 and 1968.

The Advisory Commission on Intergovernmental Relations has recommended that the states which have no personal income tax should adopt one and that those who have the tax should utilize it more effectively.³³ The personal income tax, according to the commission, represents the last underutilized major revenue source in many states. One-third of the states, including some high income sections in the country, do not tax personal income while another third tax them at relatively low effective rates.

In Kansas, the property tax is the subject of much discussion by most citizens.³⁴ All agree that the property tax in Kansas is too high and should be lowered and that there should definitely be no further increase. In order to compensate for the less or reduced reliance on the property tax by local governments, it will be imperative for Kansas to shift some of the property tax burden to other more

effective revenue sources. Figure 2 shows tax levies since 1927 at four governmental levels. Since 1960 there has been great escalation in property taxes for all types of school districts.

According to "State Governments Finances in 1967," Kansas is \$22 per capita higher than the national average for tax levies.³⁵ It also shows that in 1966 only 3.1 percent of all local taxes in Kansas came from nonproperty sources while the national average was reported at 12.9 percent.³⁶ Local governments in 35 states received a greater proportion of their total taxes from local nonproperty sources in 1966 than did Kansas municipalities.³⁷

Foundation Concepts

The foundation program concept maintains that all students throughout each state, regardless of economic or geographic consideration, should be entitled to the opportunity to receive an educational program designed to meet their needs.³⁸

The concept of the foundation program was first introduced and interpreted in the Strayer-Haig educational finance inquiry in New York in 1923.

Source: Kansas Government Journal (April, 1969), p. 159.

The foundation program plan has provided a partnership to support aspects of the educational program included in the plan. The funds needed to support the foundation program throughout the state are provided by both district and state funds on an equitable basis. Beyond this program each district may provide funds to finance additional or higher quality services within the limits of state laws or constitutional provisions.

Any defensible plan for financing public schools will enable the people of the state and each district to provide essential educational opportunities and programs for all at a reasonable and equitable cost.

Unit of Educational Need

The first step in developing a satisfactory foundation program plan is that of establishing objective, equitable, and valid measures of educational need.³⁹ While there is agreement that a sound measure of need must be developed, there are differences of opinion as to whether a single measure should be used for developing all aspects of educational need and as to the extent to which average practice should be used in deriving measures of educational need.

Burdick feels that the educational need that can solve all of the problems is non-existent.⁴⁰ It is, however,

³⁹Ibid., p. 277.

⁴⁰Larry Burdick, p. 10.

necessary to establish a unit of educational need in order to allocate funds to local districts.

Peterson states that the lack of accurate measurement of educational responsibility or need is a serious limitation when considering economic impact to state support programs.⁴¹ He indicates that the following measures of educational needs represent the major units that have been proposed or used in various forms or combination for the apportionment of state funds: area school district, taxes paid by each district, valuation of taxable property, total population, number of school-age children, the number of teachers employed, enrollment, state salary schedules based on training and experience, average daily attendance, and average daily memberships. Burke offers a similar list for identifying needs.⁴²

Mort and his associates directed their efforts in the 1920's to the discovery of better measures of educational needs and the determination of the items to be included in the state support program. They established three criteria for the selection of educational items to be included in the state support formula:

- (1) Any educational activity found in most or all communities throughout the state is acceptable as an element of state support.
- (2) Any unusual expenditure for meeting standard educational requirements over which a local

⁴¹LeRoy J. Peterson, Economic Impact of State Support Models on Educational Finance (Wisconsin, 1963), p. 46.

⁴²Arvid J. Burke, Financing Public Schools in the United States (New York, 1957), p. 575.

community has little or no control also should be recognized.

- (3) In that it could be established that unusual conditions require extended or more costly types of educational offering these should be recognized in apportioning state funds.⁴³

Units of need for developing educational responsibility for each community were then developed by Mort. This measurement depends upon average practices for determining the weighting. Mort's weighted pupil measure concentrates upon the pupil-teacher ratio factor.⁴⁴ This is usually higher in larger schools and in urban centers than in the smaller schools or sparsely settled areas. Despite criticisms, research reveals that the standard unit is still the most frequently used measure of educational needs.⁴⁵

The most frequently employed standard units of the present state support programs are weighted pupil units and weighted classroom units.⁴⁶ These measures have been developed and refined by authorities since the original Mort study, but are based upon the same central idea. Peterson lists another factor to be considered in the development of the standard unit measurement of educational need, that being the percentage of children in high school because it is more expensive to operate high schools than to operate elementary

⁴³LeRoy J. Peterson, p. 48.

⁴⁴Ibid., p. 49.

⁴⁵Ibid.

⁴⁶Ibid., p. 49.

schools.⁴⁷ Other factors for weighting to be considered are differences in the cost of living, differences between current and other expenditures, or any additional items which result in major differences in per pupil costs.

One of the most recent changes in measuring educational need was instituted in New York state during the 1962 legislative session. The density factor was given weight in determining educational need.⁴⁸ In recognition of added services that large districts provide, especially for handicapped children, additional aid may also be paid to larger districts. Johns and Morphet point to the single measure for determining all aspects of need as being the most desirable.⁴⁹ The development of a single unit for measuring educational need would have, in their opinion, advantages in analyzing the expenditures of different types of districts and among different states in developing foundation program laws. The pupil-teacher ratio is necessarily much smaller and cost per pupil in attendance or membership is much greater in smaller schools, in certain types of classes and in some grade levels, than for regular classes in larger schools. Therefore, it is necessary to develop either a weighted pupil or an adjusted classroom unit for arriving at the foundation program cost.

⁴⁷ Ibid.

⁴⁸ Burdick, p. 21.

⁴⁹ Johns and Morphet, pp. 278-279.

The chief problem with the weighted pupil unit is that it is difficult to interpret to legislators and other laymen. The adjusted classroom unit, although it is directly related in its derivation to the weighted pupil unit, is much easier for laymen and teachers to understand. Either unit may be derived on the basis of average practice. Mort and Reusser point out:

This has two very serious faults. First, practice on which the weightings are based varies from decade to decade. Second, it varies from state to state. The most serious variations are in the weightings given to secondary pupils as compared with elementary pupils. Sparsity corrections appear to be more uniform from state to state and more stable from decade to decade.⁵⁰

The weighted pupil unit is used as a cost unit for the foundation program as well as the need unit, thus attention is centered on the cost from the beginning, and tax conscious people may tend to resist improvements because the unit is directly associated with cost. This has not usually happened. Indications are that many people tend to be less concerned about the cost after they understand and have agreed upon the need.

Johns and Morphet list two points of view relating to the derivation of the adjusted classroom unit. One holds that the unit should be derived in pure form from the studies and discussions and should cover needs for all employees and services. The other holds that the classroom unit should be

⁵⁰Paul R. Mort and Walter C. Reusser, Public School Finance (New York, 1951), p. 493.

structured in terms of services needed, commencing with classroom teachers and then considering other pertinent factors and arriving at a single unit formula, similar to one derived from the first procedure.⁵¹

Other factors to consider are attendance during the current year, whether it is attendance or membership and the relation of needs to cost. Benson,⁵² Freeman,⁵³ and Corbally⁵⁴ all point to teacher salaries as an important unit to translate into costs. Several state committees have agreed upon fixed amounts per unit which should be included for instructional salaries. Other committees state that if a fixed amount is included for all districts, those which are now employing poorly prepared teachers probably would use the money in developing salary schedules for their presently employed teachers.

The value of the classroom unit thus becomes the total of the amount included for instructional salaries, the amount of current expense other than salaries and transportation, and the amount of capital outlay if this is to be included in the foundation program. The cost of the foundation program for any district then will be determined by multiplying

⁵¹Johns and Morphet, p. 280.

⁵²Charles S. Benson, The Economics of Public Education (Boston, 1961), pp. 284-285.

⁵³Roger A. Freeman, Taxes for the Schools (Washington, D. C.), National Publishing Company.

⁵⁴Corbally, pp. 118-119.

the total value of the classroom unit by the number of units in the districts and adding the allowable cost of transportation, if transportation is included in the program.

The most concise statement of what a measure of educational need should be is given by Cornell and McClune:

- (1) Include all essential elements of educational costs.
- (2) Reflect all significant cost variations due to factors beyond the control of local boards of education.
- (3) Exclude your marking or compliance features which destroy local initiative and determination.⁵⁵

McClune suggests that the increase in the use of salary schedules is due to:

- (1) The desire of the legislatures to have a specific purpose for educational funds that they can indicate to the teachers and to their constituents.
- (2) The attitudes of the teachers who want to protect what they have.
- (3) The fact that if they are properly designed they will fulfill the necessary objectives of a desirable state program.⁵⁶

Burke, who feels very strongly about the need for local control, points out that such programs cause the center of gravity in control to be shifted from the local operating unit to the state.⁵⁷ He also suggests that since salaries allowed often are weighed more in terms of experience and

⁵⁵Peterson, p. 51.

⁵⁶National Education Association, Trends in Financing Public Education, (Washington, D. C., 1965), p. 68.

⁵⁷Burke, pp. 577-578.

preparation, they may have little bearing upon the qualifications of the staff.

Research about the use of the pupil unit as a means of measurement, reflects that the most common practice has been to use the attendance of pupils during the previous year to arrive at the educational need.⁵⁸ The increasing number of rapidly growing districts, however, has made this practice unrealistic. Some state aid formulas that have been revised recently allow for increased attendance during the current year. Some difficulties, however, result from decreased attendance due to epidemics or foul weather. Johns and Morphet suggest the following possible solutions:

- (1) Basing the units on attendance during the first two or best two months.
- (2) Maintaining for each district for the three preceding years, the ratio between average daily attendance and average daily membership and automatically correcting to the average when a district during any year drops below average.
- (3) Changing from the average daily attendance to average daily membership.⁵⁹

Indications show a trend toward the third solution. The use of average daily membership is becoming more widespread. The number of pupils to be educated is clearly a rough measure of educational need. In order to make this a usable measure, certain refinements will be necessary. How to measure pupil load must be decided. Consideration must be given

⁵⁸Paul R. Mort, Walter C. Reusser, and John W. Polley, Public School Finance (New York, 1960), pp. 47-48.

⁵⁹Johns and Morphet, Financing Public Schools, p. 282.

to some type of weight for the various aspects of the school programs. When these necessary elements have been determined, the result is the weighted pupil unit. This provides a simple basis for the distribution of state funds and is advocated by Mort, Reusser and Polley who state:

The weighted elementary pupil unit has proved to be the most satisfactory measure of educational need thus far developed. The concept of the weighted elementary pupil is a simple one. Under like conditions expenditures in education vary rather closely with the number of pupils. Accordingly, it is feasible to assume that larger expenditures per pupil will give better return if there is a relationship between expenditure level and the quality of education.⁶⁰

The last measure to be reviewed is the classroom unit. It is obtained merely by dividing the number of weighted pupil units by the number of students that will constitute the desired class size. It is encouraged very strongly by Johns and Morphet:

The adjusted classroom units, although it is directly related to its derivation to the weighted pupil unit, is much easier for laymen and even teachers to understand. They can readily see the relationship between the number of teachers needed and program of services or facilities to be provided. This relationship is not so obvious in the case of the weighted pupil unit.⁶¹

Corbally agrees that the classroom unit is more desirable than the pupil unit. He indicates that the classroom unit provides a more workable base and is more easily understood.⁶²

⁶⁰Mort, Reusser, and Polley, pp. 47-48.

⁶¹Johns and Morphet.

⁶²Corbally, p. 133.

New Approach to Measuring Need

Another approach to the measure of need is the idea of using the percentage of the operating cost to determine the need of the school district. The states of Wisconsin and Rhode Island have utilized this concept in their programs for several years.⁶³ Benson is a very strong advocate of the use of a measure of need based on percentage of district expenditures. He describes this method in the following quotations:

The state shares without limit in the locally determined levels of expenditure. That is, the Rhode Island plan is truly open ended. Practically any kind of expenditure legally authorized by a local school committee is eligible for reimbursement.⁶⁴

Local Abilities to Support Education

The next factor to consider for the development of state support for school finance programs is the ability of local districts to support education. There are wealth variations in the school districts.

The definition of wealth in this project relates to the financial ability to support public schools.

There are several factors which need to be considered in measuring the ability. Some of these are dollar factors and relate primarily to the tax base within a governmental unit. Other factors influence school cost and may relate to population, geographical or sociological statistics. All state

⁶³Benson, p. 188.

⁶⁴Ibid., p. 189.

support programs that include a fiscal equalization concept and a state local sharing concept related to the ability of the local district require a method of measuring the fiscal capacity of school districts. In a research report, "Economic Impact of State Support Models of Educational Finance," Peterson suggests:

There are essentially two approaches to measuring the fiscal capacity. One approach used is indicators of economic activity, notably measures of a flow of resources out of which state and local taxes can be paid. The other approach evaluates the taxable resources--the tax basis--available within a state and estimates the amount of revenue that can be produced if they are subjected to various levels of taxation.⁶⁵

Peterson identifies three measures of ability that have received the most attention and are used as an approach to measuring fiscal capacity. They are income, economic index, and property valuation.

Income

Income, the first approach suggested, is frequently used for measuring fiscal capacity. Since taxes are generally paid out of current income, personal income is assumed to be a satisfactory measure.

Economic Index

The second technique as an approach to measurement of fiscal capacity is the economic index. In this situation, capacity is defined as a potential ability of states and

⁶⁵Peterson, p. 52.

localities to raise revenue through taxation.⁶⁶ If the uniform system of taxation reflects the present state in local tax structure, the tax basis used will be property or sales and may not correspond closely to personal income.

Property Valuation

A great many of the studies of variations in the tax-paying ability of the local school districts have used property evaluation as a measure of ability to express the fiscal capacity of the district to support education. Property values have been divided by some unit of measure of educational load, such as per capita, per pupil, per teacher, or per weighted pupil. This is the procedure used in most states at the present time.⁶⁷

Other Approaches

Cyr, Burke, and Mort concluded that a study of ability to support schools must go much deeper than the study of money, and that it must involve factors as productivity, consumption, wealth, and income.⁶⁸ Davis classified measures of taxpaying ability under three categories:

- (1) The amount of wealth possessed
- (2) The income received
- (3) The amount spent⁶⁹

⁶⁶Ibid., p. 52.

⁶⁷Ibid., p. 53.

⁶⁸Johns and Morphet, Financing Public Schools, p. 221.

⁶⁹Ibid.

Norton measured the taxpaying ability of the states by calculating the economic power behind each pupil,⁷⁰

Mort and Newcomber used still another approach in which they computed the yield of the "modern tax system" as a criterion of the relative taxpaying ability of the states. An index of the relative taxpaying ability of the states was developed by using ten economic population factors.⁷¹ Mort devised a method for measuring the ability of the state to finance education in terms of their capacity to raise state and local tax revenues. To do this he used a system where each possible measure of ability was weighted and combined in a formula for determining ability for the state to finance education.⁷² Newcomber and Chism also developed a measure of the ability of the states to support public education which has the possibility of adaptation to smaller units. Their proposal is expressed in the formula:

$$\text{Ability} = \frac{\text{Tax resources available under model tax plan}}{\text{Number of children five to seventeen years of age}} \quad 73$$

⁷⁰Ibid.

⁷¹Ibid.

⁷²Peterson, p. 54.

⁷³Paul R. Mort, Federal Support of Public Education (New York, 1936), p. 179, quoted by Peterson, p. 49.

Burke takes an approach similar to Peterson in measuring taxpaying ability only with concentration on taxation and income as measures.⁷⁴ He first identifies the fundamental problems that exist in the measurement of taxpaying ability.

Although property valuation is not a perfect measure, it can be made to meet more criteria than the economic indices or income as a measure of local ability.⁷⁵

The major limitation of existing research on fiscal capacity is conceptual. Economic indices and other measures of fiscal abilities sometimes are developed without the use of criteria of satisfactory measurement, a clear understanding of what the measure actually measures or the taxing powers of the local unit involved. The measure of relative state or local taxpaying ability which will reflect ability to raise property taxes, non-property taxes, or a combination of both must meet certain criteria. These include:

- (1) Reliability or dependability--Is it possible to obtain reliable or dependable data for each component of the measure?
- (2) Currency--Is it possible to obtain up-to-date data on each component of the measure?
- (3) Applicability--Can the data be assigned to the unit of government ability of which is being measured?
- (4) Validity--Does the income measure reflect taxpaying ability which the unit of government can reach through its taxing powers?
- (5) Universality--Can the data be obtained for all units?

⁷⁴Burke, pp. 628-656.

⁷⁵Charles S. Benson, Perspectives on the Economics of Education, (Boston, 1965), p. 364.

- (6) Equity--Can the measure be applied equitably to every unit?
- (7) Objectivity--Will the measure not be subject to state or local manipulations to favor certain areas?
- (8) Weighting--If more than one tax source is included in the measure, the question is: Is the lack of weighting or the weighting assigned to the various taxes such as to create a bias or to violate the equity criteria?
- (9) Stability--Will the measure be stable enough to avoid creating serious federal state or local fiscal problems in one year?
- (10) Acceptability--Will the various units of government accept and have confidence in the measure?⁷⁶

Patterns of State Support

Historical Developments of State Grants for Educational Services

The history of state grants-in-aid commences with Elwood P. Cubberley at the turn of the twentieth century.⁷⁷ Cubberley's approach to the problem was multifaceted. His specific proposals were relatively simple. A summary statement of his complex views of the ends of state aid is as follows:

Theoretically all the children in the state are equally important and are entitled to have the same advantages; practically this can never be quite true. The duty of the state is to secure for all as high a minimum of good instruction as is possible, but not to reduce all of this to minimum; to equalize advantages of all as nearly as can be done with the resources at hand; to place premium on those local efforts which will enable communities

⁷⁶Burke, p. 636.

⁷⁷Benson, The Economics of Public Education, p. 154.

to rise above the legal minimum as far as possible; and to encourage communities to extend their educational energies to new and desirable undertaking.⁷⁸

Cubberley examined data from Indiana, Washington, Kansas, California, Missouri, and Wisconsin, and was convinced that inequalities in quality of school programs and in local tax loads were likely to be found over the whole of the United States.⁷⁹ He found a positive correlation between the low quality of programs and high tax loads. He therefore concluded:

Any attempt at the equalization of the opportunities for education, much less any attempt at equalizing burdens is clearly impossible under a system of exclusively local taxation. Some form of general aid is a necessity if anything like common advantages are to be provided at all.⁸⁰

The contributions by Strayer and Haig presented some essential elements of new theory in educational finance. It constituted the background for studies and developments that have resulted in revolutionizing provisions for financing schools in most states.⁸¹

Paul Mort actually developed the basic techniques for applying the Strayer-Haig model, directly and through subsequent studies made by his students.⁸²

⁷⁸Elwood P. Cubberley, State School Funds and Their Apportionment (New York, 1905), p. 17.

⁷⁹Benson, p. 156.

⁸⁰Cubberley, p. 17.

⁸¹Johns and Morphet, The Economics and Financing of Education, p. 244.

⁸²Ibid., p. 174.

The third strand in the development of thinking about state grants for school services derives from a report by Harlan Updegraff and Leroy King. In their "Survey of Fiscal Policies of the State of Pennsylvania in the Field of Education" (1922), they urged the adoption of what has lately been called the percentage equalizing grant.⁸³

The final concept for the development of state support to consider is complete state support. The chief advocate of this practice was Henry Morrison of the University of Chicago.⁸⁴ His views are unique for his time and there are two central themes in his work:

- (1) The limits of public responsibility
- (2) Equality of educational opportunity

With respect to public responsibility, Morrison drew a sharp distinction between private schools and public. Private schools are extensions of instruction offered in the family and directed toward the attainment of private or household objectives. He further states that:

The school does not become a public school simply by being open to the public. It must exist for a public or social as distinct from a private purpose.⁸⁵

⁸³ Benson, p. 162.

⁸⁴ Morrison, Henry C., School Revenue (University of Chicago Press, 1930), p. 9, quoted by Benson, p. 163.

⁸⁵ Benson, p. 166.

Elements of Design

The three types of state aid patterns are (1) flat grants, (2) flat grants and special aids, or (3) equalization (need and ability considered) with or without flat grants or their equivalents in minimum guarantees.⁸⁶

Barr defines a flat grant as a specified amount per pupil which completely disregards variations in the local taxpaying ability, but does afford tax relief to local districts.⁸⁷

Another type of grant-in-aids mentioned is special aid, in supplement of flat grants. Supplements may include payment in all or part for some specific phase of education.⁸⁸ Kansas, at present gives special grants for educable mentally retarded classes, gifted classes, and vocational education.⁸⁹ This aid is distributed in the forms of fixed teacher unit grants.

Benson is critical of this type of grant because the richest district can produce a fixed expenditure per pupil at a much lower levy than poorer districts.

The third form of grants-in-aids mentioned is that of equalization with or without flat grants or minimum guarantees. When the two (equalization and flat grants) are

⁸⁶Mort, Reusser, and Polley, p. 255.

⁸⁷W. Monfort Barr, American Public School Finance (New York, 1960), p. 255.

⁸⁸Mort, Reusser, and Polley, p. 215.

⁸⁹Kansas State Teachers Association, Kansas State and County Finance Programs (Topeka), p. 2.

combined in a foundation program, the result may be a well defined equalization program in which each school receives at least the amount of the flat grant.⁹⁰

Benson states that there is a strong preference for equalizing grants. He mentions two types of equalization grants differing from fixed unit equalizing grant. The variable unit equalizing grant is a form quite similar to that of the fixed unit form.⁹¹ The basis for the variability, with which the state provides support is normally the teacher with advanced degrees and experience.

In the variable unit phase, the expenditure per pupil which the state will grant support is variable within limits depending upon the quality of educational resources the local district determines.

The other type of equalization grant is that of percentage equalizing. There are only two basic features of this:

- (1) The state pays some shares to locally determined school expenditures in a given district.
- (2) The state share is larger in poorer districts than in the rich.⁹²

In determining the state's share in this plan, it is necessary to calculate the ratio of tax base per pupil in the district and the state tax base per pupil. The relative

⁹⁰Barr, p. 167.

⁹¹Burkhead, p. 214.

⁹²Ibid., p. 214.

economic standing of a given district is thus established in the form of

$$\frac{y^1}{y}$$

Where y^1 is the tax base per pupil in the school district and y is the state tax base per pupil. Next this ratio is multiplied by an arbitrary constant (x) which normally has a value between 0 and 1 (as a first approximation the value of x can be taken to represent the local share of educational expenditures in the state). Finally, the product of x times the relative economic standing of the school district (x times $\frac{y^1}{y}$) is subtracted from the numeral 1. The resulting figure, ordinarily a fraction, is the state share support in that particular district. Benson makes the following illustration to show how the formula works:

$$A_i = \left[1 - \left(.5 \frac{\$15,000}{\$30,000} \right) \right] \times \$400,000 = \$300,000$$

(state share) (local share) (total expenditure) (state share)

\$15,000 = school district tax base per pupil
 \$30,000 = state tax base per pupil
 .5 = constant guarantee of 50% equalized support

The state share in this poor district is 75 percent of expenditures. The state share in the district of \$45,000 per pupil valuation then would be 25 percent. Each of the districts could provide a program costing \$400 per pupil with the same level tax rate of 6.7 mills. In the general case this formula works as a resources equalizer.⁹³

Formuli for State Apportionment

In an article by R. L. Johns, "Economics and Financing of Public Education," eight different formuli for state apportionment are presented. Major emphasis is given toward

⁹³Ibid., p. 215.

integrating state funds with local funds. Some of them can, if necessary, be adapted for the inclusion of Federal funds in the total plan. Johns states that it should be possible to devise a plan that will assure reasonably adequate educational opportunity for all students in each state with a high degree of equity for all taxpayers.⁹⁴ While few states have come close to achieving this objective, Johns still sees the possibility for them to do so because of the knowledge, insight and skills that make feasible major improvements available.

Formula 1: Complete State Support of the Foundation Program.

Under this model the state would provide a basic amount per weighted pupil or per classroom unit entirely from state funds, and local financing in addition to the state supported foundation program would be optional. If it is assumed that there are limitations on the potential state revenue available, this alternative might not be available. Furthermore, since the state would provide the entire cost of the minimum program from state funds, the legislature would probably reduce the local tax limit below a certain millage. Experience with this type of model has shown that it is difficult to persuade the people to levy a substantial amount of local supplementary taxes in many school districts.

Formula 2: A Flat Grant of a Uniform Amount Per Weighted Pupil or Per Classroom Unit.

If the legislature has available a certain amount per weighted pupil, this formula makes available a flat grant of that amount per weighted pupil (or per classroom unit).

⁹⁴R. L. Johns, "Economics and Financing of Public Education," Compact, February, 1968, pp. 8-11, (excerpts from Designing Education for the Future, May, 1968).

Formula 3: Match Mandated Local Funds with State Funds on a Dollar-for-Dollar Basis.

This is an antiquated, discredited formula, but it is still suggested from time to time in state legislatures.

Formula 4: Equalized Matching.

Under this formula, local funds are matched with state funds in the ratio that the equalized valuation of the district per weighted pupil bears to the state average equalized valuation per weighted pupil. This formula unadjusted assumes a ratio of 50 percent local funds to 50 percent state funds for the state as a whole.

Formula 5: The Strayer-Haig Model.

Compute the cost of the foundation program, deduct from the cost of that program the amount that can be raised by the district from a mandated minimum levy on the equalized valuation, and provide the difference from state funds. This formula or an adaptation of it is now used to apportion more than 60 percent of all state funds apportioned to local boards.

Formula 6: The Percentage Grant or State Aid Ratio Formula.

The state's share of the cost of the foundation program of a district under this formula is computed by multiplying the cost of the district program by 100 percent minus a predetermined percentage figure multiplied by the quotient of the equalized value of district property divided by the state average equalized value of property per pupil.

Formula 7: An Equalized Matching Incentive Added to the Foundation Program.

Under this formula an equalized matching grant is added to the foundation program such as provided for in Formulas 5 and 6, in order to stimulate local tax effort in addition to the local effort mandated in the foundation program. The purpose is to stimulate local boards of education to make necessary innovations and to move toward a quality level educational program.

Formula 8: An Incentive Grant Provided by Matching Optional Local Taxes in the Same Ratio of State to Local Funds as Provided in the Foundation Program.

The ratio of state to local funds in the foundation program can readily be computed from either Formula

5 or 6. It is assumed that this type of incentive grant will be added to the foundation program provided for in either Formula 5 or 6 and will require more state funds than Formula 7 if the state average percent of the cost of the foundation program exceeds 50 percent.

This formula provides for complete equalization of educational opportunity in all districts willing to make the same local tax effort in proportion to ability, and it provides a powerful incentive for additional local effort, especially from the less wealthy districts.

An Adaptation of the Strayer-Haig Formula

Morphet and Johns have developed an adaptation of the Strayer-Haig Formula which is now being used by a number of states. Although the measure of "weighted pupil" is a very useful measure in state support, they found it very difficult to explain. It was easier to explain the term "classroom unit" is derived from weighted pupils, it is a function of that measure and just as useful. This state support model is based on educational services provided and is more directly aimed at improving school quality than the original Strayer-Haig model. This method of calculating the cost of the foundation program might be termed a type of program budgeting. It could also be termed PPBS or a program planning budgeting system for determining the cost of the foundation program. This methodology also lends itself more readily to systems analysis than any other state support model.

...this adapted plan provides for the following procedures in determining the cost of the foundation program:

- (1) calculate the cost of instruction by multiplying the allotted classroom units by appropriate cost scales;
- (2) calculate the amount allotted for transportation by cost scales which give due consideration to the number of pupils transported and the density of transported pupils;
- (3) calculate the amount allotted for other current expenses by multiplying the number of classroom units by a flat amount computed on the basis of average costs;
- (4) calculate the amount allotted for capital outlay and debt service by multiplying the number of classroom units by a flat amount determined by the average annual depreciation costs of school plants.

These items are summed in order to determine the total cost of the foundation program and from this amount is deducted the mandated local levy as in Formula 5, the difference being paid from state funds.⁹⁵

The Wisconsin Plan

One of the more challenging approaches to the school finance problem has been taken by the state of Wisconsin. Instead of requiring all communities to tax at the level established for the foundation program in order to get any or all of the equalization aid desired, Wisconsin provides for whatever level at which the community is operating. The state's proportionate share and local proportionate share will be the same as it would be in the prescribed foundation ~~level.~~⁹⁶ For example, if the state aid to which a community would be entitled, when it is operating the full foundation

⁹⁵Ibid.

⁹⁶Mort, Reusser, and Polley, p. 268.

program were a third of the total, then the community, regardless of the foundation level, will still receive a third of the cost from the state and provide two-thirds of the cost locally. There is a limit, however, which defines the foundation level for which the state is directing its efforts and the local contribution associated with it. These limits are presently set at a maximum of \$315 per pupil and 15 mills.⁹⁷

Another procedure used by Wisconsin is to establish the foundation level and local rate and then withhold state aid equal to that which the community saves by using a lower rate.

Flexibility in state support can be achieved through one of two possible avenues in Wisconsin. First, the local tax impact can be reduced materially by increasing the guaranteed valuation per resident pupil. The biennial adjustment of the guaranteed valuation per pupil permits a realistic adaptation of the formula. A second factor in the Wisconsin state support program which takes into account the limitation of local resources is found in the states willingness to assume the total portion of the cost behind the local maximum effort. Because of its flexibility, the Wisconsin system of

⁹⁷Ibid.

state aid for education can distribute the financial load between the state and local school districts so that the school districts are able to provide for and improve their educational programs.⁹⁸

The Rhode Island Plan

Rhode Island's foundation program in operation since 1960, is also an innovation in state local partnership for school support.⁹⁹

It is virtually unique among grant formulas used by state governments in our country. The Rhode Island formula provides that the state will share in locally-determined educational expenditures, without ceilings on the level of expenditures. The open-ended, matching grant program is a definite improvement in both principle and practice over the foundation programs found in many states.¹⁰⁰

In the administration of this matching formula there are two major points to be determined. The first is the level of expenditures in which the state will share, and the second is the matching ratio to be applied to any given expenditure. In Rhode Island each regional school district reports its expenditures on the current operation of its public schools, and these reports constitute the basis for determining school expenditures in which the state will share.

⁹⁸Benson, p. 332.

⁹⁹Norton, John K., ed., Dimensions of School Finance (NEA Committee on Educational Finance), p. 172.

¹⁰⁰Ibid., p. 173.

The second point is somewhat more complicated. The General Assembly determined that no district would receive less than 30 percent of its last year's expenditures.¹⁰¹

This provision means that in the richer localities, as measured by value of property, degrees of wealth do not affect the sharing ratio; but a flat rate of sharing is established for each of the more affluent communities.

For other local authorities, the specific sharing ratio is determined by the relation of equalized weighted assessed valuation (EWAV) per resident pupil in average daily membership in the public schools of the local authority to statewide average. The formula aims at establishing a close, positive relationship between expenditure per pupil and local school tax rates on equalized valuation. If Town X decides to spend twice as much per pupil as Town Y, it can expect to have a tax rate approximately twice as high as Y does. The local tax rate becomes a "price" for educational services.

The equalized weighted assessed valuation of each community in the state is adjusted by the ratio that the median family income in the community bears to the median family income for the state. This adjusted equalized weighted assessed valuation is used as one of the bases for determining the local ability to support the basic program.

As described by Benson, this approach is not characteristic of school finance in the United States. Rhode Island's

¹⁰¹Rhode Island Department of Education, Title 16, Chapter 7, State Support for Rhode Island Public Schools, p. 2.

plan has been described as a notable advance in equity in state-local fiscal relations.¹⁰²

The California Plan

The foundation program in California as revised in 1955-56 provides per pupil aid from kindergarten through junior college.¹⁰³ California has an extensively developed system of school grants based mainly on the fixed unit equalizing concept. They also make use of categorical aid. In 1966-67 California employed three equalizing grants.¹⁰⁴ For elementary schools the foundation program is defined as \$249 per unit of average daily attendance. The local contribution rate is 60¢ per \$100 of assessed valuation. For high school attendance the foundation program is \$339. The local contribution is 50¢ per \$100 of the assessed valuation. "For unified districts" those comprised of both elementary and high school grant entitlement is computed separately for the different levels of school attendance. In addition there are supplementary grants in which approximately the poorest half of the district can obtain extra aid if they are willing to tax themselves above local contribution rate. This grant is variable:

- (1) By the level of assessed valuation per pupil in the district.
- (2) By the level of local school tax rate.

¹⁰²Benson, p. 186.

¹⁰³Barr, pp. 168-169.

¹⁰⁴Benson, p. 186.

No extra aid can be earned in elementary districts if the tax rate reaches \$1.60.¹⁰⁵

The system of public school support effects a partnership between the state and the local educational agency whereby each contributes to the support of the educational programs for all who attend the public schools.

Revenue is derived from (1) local taxes levied upon the assessed valuation of property in the local agency; (2) state taxes levied for general purposes; (3) federal taxes levied for general purposes and allocated to the state or directly to the local agency for public school purposes; and (4) miscellaneous revenues received by the local agency.¹⁰⁶

Certain claims can be made for California school support. An enormous influx in population has been accommodated without resort to any economy devices. California teacher salaries are generally among the highest in the nation. The state has also developed a magnificent system of public higher education.¹⁰⁷

Benson, however, calls attention to the shortcomings about the California finance plan:

(1) A considerable variation exists among districts in expenditure per pupil and there is no evidence that these

¹⁰⁵Ibid.

¹⁰⁶Ray H. Johnson and Edwin H. Harper, eds., Structure of Public School Support and Recommendations for Improvement (California State Department of Education).

¹⁰⁷Benson, p. 188.

differences are so arranged that educational output of the state is maximum. Interdistrict tax rate differentials are substantial.

(2) Though the legislature has seen fit to revise the amounts of the foundation program upward at frequent intervals, a substantial volume of additional school aid is dissipated in tax relief and flows over into the support of other local government services. A recent study of this problem reports:

It is concluded that of the 1952-53 changes in California state aid to education, only approximately 20 percent went to increase total educational expenditures beyond what they would have been if there had been no change in state aid. More than 65 percent of the change in state aid was employed by local government to reduce their local tax burdens, and somewhat less than 15 percent was shifted to the financing of other governmental grants.¹⁰⁸

(3) The large cities in the state feel they are receiving insufficient funds in view of the cost of education in high density areas. This complaint is by no means peculiar to California and some states including New York have been quick to respond to it.¹⁰⁹

The Washington Plan

The law under which state funds are allocated to school districts in Washington was revised completely by the 1965 session of legislature.¹¹⁰ Under the former distribution

¹⁰⁸Ibid.

¹⁰⁹Ibid.

¹¹⁰State of Washington, 49th Biennial Report of the Superintendent of Public Instruction, June, 1968.

formula, a major portion of state funds (about 85 percent) was paid on the basis of flat grants irrespective of variations among school districts in the relative wealth per pupil enrolled. The new formula provides for a guaranteed equalized amount from state designated local funds for each pupil enrolled in programs approved by the State Board of Education. On the basis of state funds appropriated for the regular K-12 school programs, the guaranteed amount for the 1966-67 school year was \$326 per weighted pupil. The comparable figure for 1967-68 was \$350. To arrive at the average annual weighted enrollment for each district, one or more of the following weighting factors were used:

- (1) (.5) for each child enrolled in kindergarten.
- (2) (.3) additional for each pupil enrolled in grade seven through twelve.
- (3) (.2) additional for each full time equivalent pupil enrolled in approved vocational classes.
- (4) (.1) additional for each pupil enrolled in a program conducted for the culturally disadvantaged.
- (5) A range of 0 to 19 additional per pupil enrolled to provide in part for higher salary costs incurred by certain districts, by reason of the added professional preparation and/or longer years of experience in the educational profession by their staffs.
- (6) A range of .002 to 2.0 additional for each pupil enrolled in elementary districts which have been determined by the State Board of Education to be "remote and necessary" in which there are less than 100 pupils enrolled.
- (7) A range of .001 to 2.0 additional for each pupil enrolled in high schools which conduct programs approved by the State Board in which the total enrollment in grades 9-12 is less than 250.

The Florida Plan

The computation of the Florida foundation program includes a number of instructional units based on the average daily attendance and varies with the training and certification of the teachers employed in the county.¹¹¹

Additional allocations provide for current expenses, capital outlay, and transportation. The distinguishing feature of this type of program is a reward for employment of the better training and certificated teachers which is often available only to the fiscally able counties. The foundation program is defined in such a manner that all school services are included. The only special aid is a purchase of textbooks. An interesting feature of the Florida fiscal policy is the earmarking of receipts of certain taxes that are the source of funds for state support of capital outlay and debt services. Rewards for effort, which increase the amount of the foundation program in fiscally able districts, increases the state support to such districts. This counteracts the equalization which would normally reduce support to wealthy districts.

Thus, it may be seen that the plan proceeds in three clear-cut steps:

- (1) Calculate the cost of providing the minimum educational opportunities considered as reasonable and essential, including funds for instructional salaries, transportation, other current expenses, and capital outlay.

¹¹¹Barr, p. 170.

- (2) Calculate the sum of money which the counties must supply toward meeting the cost. The amount to be contributed by the 67 counties collectively is 3 mills on the non-exempt assessed valuation of property in the state. Each county provides its proportion of this amount as determined by an index of taxpaying ability. In 1969-70 the Index of Taxpaying Ability will no longer be used.
- (3) Provide from state funds that which is necessary to make up the differences between the total cost of the program and what the counties must provide.¹¹²

The Minimum Foundation Program provides funds for new buildings, new school sites, new permanent equipment, and major additions and alterations. These Capital Outlay Funds are allocated on the basis of \$400 per instruction unit and are guaranteed by the state constitution.

Although the major portion of the funds for the support of public schools in the state is provided through the Minimum Foundation Program, other supplementary funds are invaluable in providing adequate financing of the school system. The most important of these is Additional Local Funds which supplement the operations provided for by the MFP and support those aspects of the program which have no specific allocation under the MFP. County funds come primarily from local ad valorem taxes.

The state provides additional funds independent of the MFP. Each separate support program typically is directed at a particular aspect of the program. Among these are: Additional Capital Outlay (matching funds for school construction), Textbook Fund, and Driver Education, School Sales Tax Fund (earmarked for retirement matching). The Racing Commission Fund, although often listed as county revenue, in actual fact come through the state treasury and are transferred to the county where they are used as if they were local revenue.¹¹³

¹¹²Florida State Department of Education, Florida's Education Program, Tallahassee, Florida, 1968, pp. 38, edited by Floyd T. Christian.

¹¹³Ibid.

The Peterson Model

In 1963 a very constructive contribution to educational research was completed at the University of Wisconsin under the direction of Leroy Peterson. A number of scholars in public school finance throughout the United States devoted time and energies and served as an advisory committee to Peterson.

His report provided a background for better understanding of many facets of the school finance. He examined the impact of changes over a period of time as well as state support to schools and other municipal functions in Wisconsin. The purpose was to identify changes which took place when state support to either the school district or the municipalities was substantially altered.

The research involved educational and financial analysis of six types of school districts in each of four states. Other than Wisconsin the states of New Jersey, Oregon, and Tennessee were surveyed for the project. General information was received in order to achieve a better understanding as to how each state support program operates. Peterson draws together some concluding statements from the major findings of the research. These findings form the basis for developing and refining the hypothetical model for state support. In the final chapter of the project, the hypothetical model created by the project staff is operationalized. This model was designed to incorporate the results of the analysis of the data. The ultimate goals are aimed

toward adequate support and greater equity in educational finance.¹¹⁴

Proposed Kansas Plans

Since the present foundation plan for financing public elementary and secondary schools was implemented in 1965, there have been numerous proposals to change the distribution formula by various potent interested power groups. The list includes the Kansas Farm Bureau, Kansas Association of School Boards, Kansas State Teachers Association, and the Kansas State Department of Education. The two most recent plans that may possibly cause some impact toward changing the distribution formula were submitted by the State Department of Education and the Kansas Association of School Boards.

Dr. Taylor Whittier, recently appointed commissioner of the Kansas State Department of Education, has submitted a proposal.¹¹⁵ The chief features are as follows:

- (1) A shift of approximately 100 million dollars of the tangible tax load to non-ad valorem sources. By establishing a 100% surtax on all state income tax liabilities, the state would realize approximately 100 million dollars with which to increase support for school districts and reduce local property tax levies. That portion of the surtax paid by residents of districts (approximately \$74,500,000) would be returned directly to the respective districts.
- (2) Improved equalization of state-wide school support. The plan would provide every district

¹¹⁴Peterson, p. 5.

¹¹⁵Kansas State Department of Education, A Plan for State Aid to Kansas Schools (Topeka, Kansas, December, 1969), p. I.

with a level of support as measured against a state median of operating costs according to categories of enrollment.

- (3) A state-shared guarantee geared to actual yearly costs of school operation.
- (4) Elimination of the county school foundation assessment with its questionable economic index.
- (5) Determination of the financial ability of each local district by actual dollar revenue derived by that district rather than in terms of a state-wide index. As applied to the 1970-71 fiscal year, the plan would provide for approximately 57 percent of the \$376,000,000 estimated total operating costs of school districts to be funded by the state from non-property tax sources.¹¹⁶

The equalization formula proposed is:

$$\text{State Equalization Aid} = \frac{\text{District Enrollment} \times \text{Per Pupil Guarantee} - 25 \text{ mills tax on adjusted valuation}}{\text{Residents' State Income Surtax}}$$

The total district enrollment from kindergarten through grade 12 as of September 15 of the operational year, with adjustments for increased enrollments at midyear. Each kindergarten pupil counts as one-half.

The per pupil guarantee becomes the basis of the state shared guarantee. It is established from operating costs of school districts over the preceding year, taking into consideration the variation in expenditures among districts with various levels of enrollment.

Enrollment Range	Estimated Guarantee for 1969-70
2,000 plus	\$594
1,000 - 1,999	653 - .059 (E-1000)
900 - 999	683 - .30 (E-900)
800 - 899	725 - .42 (E-800)
700 - 799	737 - .12 (E-700)
400 - 699	760 - .0767 (E-400)
Less than 400	760

¹¹⁶ Kansas State Department of Education, A Plan for State Aid to Kansas Schools (Topeka, Kansas: December, 1969), p. 1.

On January 19, 1970, the Kansas Association of School Boards Finance Committee presented a new formula for the Kansas Legislature to consider for distributing school funds to public schools.¹¹⁷ The KASB Plan is divided into three major categories:

- (1) The state-shared guarantee
- (2) The definition of local ability
- (3) Other finance recommendations

The basic formula recommended by the Committee may be stated as follows:

$$\text{State Aid} = \text{Enrollment} \times \frac{\text{Guarantee}}{\text{Per Pupil}} \times .075 - .015 \times \text{AAV}^* - \frac{\text{Income Tax Revenue}}$$

*AAV = Adjusted Assessed Valuation

The state-shared guarantee represents the total amount of money which is to be financed by all levels of government involved in the financing of schools--federal, state, county and local.¹¹⁸ The KASB proposes that the guarantee be based on the actual operating expenditures of school districts for the preceding school year, taking into consideration the variation in expenditures found in districts with varying levels of enrollment. The formula would incorporate this principle:

¹¹⁷KASB Finance Committee, Report of the KASB Committee on School Finance to the KASB Delegate Assembly (Topeka, January 18, 1970), p. 2.

¹¹⁸Ibid.

<u>Enrollment Range</u>	<u>Guarantee Per Pupil</u>
2,000 or more	\$594
1,000 - 1,999	\$653 - .059 (E*1000)
900 - 999	\$683 - .300 (E-900)
800 - 899	\$725 - .420 (E-800)
700 - 799	\$737 - .120 (E-700)
400 - 699	\$760 - .0767 (E-400)
	\$760 *E=Enrollment

The .75 factor in the above formula is a procedure used to reduce the expenditure scale in order that it will be compatible with the revenue sources. The expenditure scale is derived from the total expenditures of all school districts. The foundation plan to be calculated, however, is intended to finance only that part of the total expenditures which come from the state foundation plan and the local tax levy. Therefore, it is necessary to reduce the total expenditures by the amount derived from (1) all federal aid, (2) all county aid, and (3) that part of state aid other than the foundation plan in itself. In 1968-69, the total amount derived from these sources amounted to about 25% of the gross expenditures.

In the preceding KASB proposal, local ability was defined solely in terms of the adjusted assessed valuation of the district, and was arranged in the form of an index, in which certain percentage values of state aid were assigned to designate ranges of assessed valuation per pupil. The committee now recommends that the entire Kansas state income tax on personal income be earmarked as a revenue source for the school district in which the individual taxpayer resides. The state income tax would be collected by the state, but would be returned directly to the school district in which

it was collected, as a revenue source. The amount received from this source, combined with an amount equal to the proceeds of a property tax levy of 15 mills on the adjusted assessed valuation of the school district, would constitute "local ability" and would be deducted from the state-shared guarantee. It would not, however, be mandatory for the school district to make the 15 mill levy.

The local contribution rate, or "local ability" is based upon the adjusted assessed valuation of the school district. Since the objective is 50% state support, the .50 index is assigned to the valuation range representing the school district in which the median child resides. In 1967-68, this median fell in the 8,000-8,999 range.

<u>Adjusted Assessed Valuation Per Pupil</u>	<u>Index</u>
\$ 3,000 - 3,999	.60
4,000 - 4,999	.58
5,000 - 5,999	.56
6,000 - 6,999	.54
7,000 - 7,999	.52
8,000 - 8,999	.50
9,000 - 9,999	.48
10,000 - 10,999	.46
11,000 - 11,999	.44
12,000 - 12,999	.42
13,000 - 13,999	.40
14,000 - 14,999	.38
15,000 - 15,999	.36
16,000 - 16,999	.34
17,000 - 17,999	.32
18,000 - 18,999	.30
19,000 - 19,999	.28
20,000 - 20,999	.26
21,000 - 21,999	.24
22,000 - 22,900	.22
23,000 or above	.20

An evaluation of this formula shows greater equity for distribution of state funds in comparison to past KASB proposals. The distribution tables, however, still reveal that the lion's share would be allocated to the urban communities. The criteria of quality element has been completely removed and all districts are being penalized by federal funds, while only a limited number of districts receive the federal impacted school support. This formula displays some characteristics of the Strayer-Haig model.

Similar formulas submitted to the Legislature for consideration were proposed by the KSTA and Kansas Farm Bureau.

The Political Process and Its Implications

School districts are governmental units and because district voters have ultimate responsibility in the operation of schools, board members, superintendents and other school officers are involved in politics. Garvue refers to the study of politics as a phenomena that has been humanized in most recent decades by greater attention to role players such as superintendents, teachers, and legislators in political situations.¹¹⁹ He feels that this new trend is beginning to replace the emphasis placed upon constitution terms and statutes.

Ostrom cites the efforts to insulate the schools from politics have been paralleled by a comparable effort to

¹¹⁹Garvue, Modern Public School Finance, p. 14.

commit larger areas of decision making to the professional personnel, especially to the professional administrative staff within a school system.¹²⁰

Education is one of the most thoroughly political enterprises in American life and more money is spent for education than for any other single function of state and local government.¹²¹

The fact that there has been so many attempts to illuminate the politics of education is in itself worthy of comment. Part of the puzzle is that the profession of political science itself, with a few notable exceptions has ignored the subject.¹²²

Burkhead points out that the strongest obstacle encountered by state support of public schools comes through the political process.¹²³ The issues relating to the financing of education often are complex and difficult to resolve satisfactorily even under favorable conditions. In a majority of the states a major portion of the funds for the support of elementary and secondary schools is still derived from local sources.¹²⁴ Due to economic factors there has, however, been an increasingly higher percentage of funds for school support provided by the states. This has brought about a focus of

¹²⁰NSSE Yearbook, Social Forces Influencing American Education, (University of Chicago, 1961), Vincent Ostrom, Chapter 2, "Education and Politics," p. 32.

¹²¹Burkhead, p. 93.

¹²²Ibid.

¹²³Ibid.

¹²⁴Ibid., p. 38.

decision making shifting from the local school systems to the states and eventually the federal government.

As described by Burkhead, the base of politics is a significant historical fact.¹²⁵ Throughout its development, public education has been heavily local and unstandardized with common recurring tensions of special elements to the politics of state aid. He identifies four of these historic issues:

- (1) Religion
- (2) Control of state educational apparatus
- (3) Localism
- (4) Urban rural rivalries¹²⁶

In the political phenomena, Burkhead refers to the cohesiveness between school men and their friends as building upon the fundamental concerns of parents and the citizenry at large for adequate education. He devised the pro-school into four groups: First, is the educational academic. Second, the officials in the state government. The third type consists of the professional educators. Finally, there are the "surprise actors" aligned with public schools but which for subtle reasons make common cause with the school men.¹²⁷

While the school men have proponents, there are also opponents. The steady increase in general aid to education since World War II indicates some lack of

¹²⁵Ibid., pp. 93-94.

¹²⁶Ibid., p. 96.

¹²⁷Ibid., pp. 104-115.

success by the opponents of school men. Burkhead, however, notes that more school men would contend that state legislatures would have gone much further than they have in state aid had it not been for both overt and invisible opposition. The political process involves dynamic tensions. In the case of state aid, most of the school men are highly visible, even when they are unsuccessful. Burkhead identifies the possible depressants, imagined and real, as follows: The Roman Catholic Church, tax-minded business depressants, localism, conservative politicians, and the splintered school men.¹²⁸

It would appear that self-interest would dictate a massive and uniform opposition of loyal Catholics to increased spending for public schools. Burkhead, however, states that this logical inference is not supported by empirical evidence. Though local priests and local politicians have often responded negatively to demands for increases in local public education budgets, there have been scores of examples of Catholic laymen, Catholic members of local school boards and Catholic politicians, taking the leadership and promoting the cause of public education in the heavily Catholic districts.¹²⁹ Burkhead's recent study in the northeastern part of the country reveals such activities. Therefore, there is not sufficient evidence to state that the Roman Catholic Church has been a depressant upon state aid to education.

¹²⁸Ibid., pp. 104-115.

¹²⁹Ibid., pp. 118-119.

Some writers have identified tax-minded business groups as being as opposition to the school men. Even when increased taxation is deemed necessary or inevitable, many business groups fight additional taxes until they are satisfied that the incident of taxation is relatively favorable to business centers. Therefore, they must be considered one of the prime reasons why some states fail to be successful in promoting new state aid for public schools.¹³⁰

The most persuasive and persistent of depressants on state school subsidies is rural localism.¹³¹ These depressants are not necessarily against good schools. Their main concern, however, is to oppose and if possible to prevent the growth of the power of state governments. They are devoted to the thesis that each school should stand on its own foundation. It is a level of operation that they love too intimately and manage too handily to delegate.

Conservative tax-minded legislators are both an effect and a cause of conservative ethos in the political life of the state.¹³² Being bolstered in their attitude by editorial support in generally conservative press, they are often elected with the active support of powerful business interests. Appropriation committees become foci for conservatism, and they usually set priorities in the funds they allocate.

¹³⁰Ibid., pp. 119-120.

¹³¹Ibid., p. 120.

¹³²Ibid., p. 121.

Their ax is not aimed at school subsidies alone as education is not the only item on the agenda of the state budget. The competition for state money frequently comes at a time and place which makes the situation a major depressant for additional state aid to education.¹³³

Burkhead says that on many occasions school men have made their own programs easy to oppose.¹³⁴ The most common handicap to increasing school subsidies in some states has been the inability of school men to work cooperatively for one responsible school bill. On numerous occasions school groups will publicly take opposite sides on the same bill. Some are backers of general state aid, while others favor state subsidies for local operating expenses. Burkhead describes the political activity by school men as amateur politics and points to this lack of political sophistication and discipline among school men as the major factor for depressing state aid assistance. Many law makers would respond favorably to financial appeals that school men can make when they agree on common goals. This is because legislators do find it difficult to withstand coordinated pressure from their grass roots.

Burkhead concludes:

That those who believe state government must share even larger burdens of the cost of public education in years ahead, must realize that the road to increased state aid is political. They must develop

¹³³ Ibid., p. 121.

¹³⁴ Ibid., pp. 122-123.

intellectual private interest groups, bureaucratic and political leadership capable of defining goals and mobilizing effective power for the realization of these goals.¹³⁵

Use of Power Resources in the Support of Educational Projects

No school system that was headed by school board members, school administrators, or leading teachers who were political eunuchs ever progressed professionally. Strong professional leadership is probably the most critical factor in initiating educational progress.¹³⁶ Therefore, educators must make maximum use of the power resources available to them in enlisting the cooperation of existing power-wielders and become major political entities if they are to utilize their resources efficiently for support of good schools.

Some of the most effective school administrators are those who have used the power of others.¹³⁷ Thus, one of the essential responsibilities of the educational leader is to collect the facts and personally see that they are made available to influential leaders in the school district.

Some of the most disastrous failures occur because attempts to initiate educational policies are made without factual support.

¹³⁵ Ibid., p. 128.

¹³⁶ Ralph B. Kimbrough, Political Power and Educational Decision-Making. Rand McNally & Co., Chicago, 1964, p. 277.

¹³⁷ Ibid., p. 277.

A school superintendent, principal, or teacher may develop his position in the leadership interaction pattern as an effective resource.

The most effective power resource which teachers can develop and exercise control over is professional solidarity. The long-range goal in this direction should be further to develop the profession of teaching. Bailey like Burkehead found that the splintering of school men was a major depressant to state support for education. He states:

Frequently schoolmen themselves have made their own programs easy to oppose. Far and away the most common handicap to increasing school subsidies has been the inability of schoolmen to work and speak as one for a responsible general school aid bill. Effective organization is exceptional. Most of the time in disorder and naivete are the schoolmen's outstanding political characteristics.¹³⁸

Through forceful leadership there is reason for optimism even in the face of a monopolistic power structure. There is no greater deterrent to educational politics than fear or pessimism on the part of the school leaders.

Economic Impact

Education may be viewed as an industry, one in which resources are used to produce given products and services.¹³⁹

¹³⁸ Ibid., p. 278.

¹³⁹ Swearingen, Eugene L., Helmer E. Sorenson, and Richard P. Jungers, "The Relationship of Economic Theory to Educational Finance," The Theory and Practice of School Finance, eds. Warren E. Gauerke and Jack R. Childress (Chicago, 1967), pp. 24-35.

It can be viewed as a big industry due to the large portion of the total population involved either as a paid employee or consumer.

Our public education system is uniquely American in that it guarantees a minimum education (12 grades) to everyone who has the ability and desire to attain it.¹⁴⁰ Recent research, however, indicates that there has been an existing shortage as high as 127,000 classrooms in the primary and secondary schools.¹⁴¹ This has required at least a half million persons to attend school for less than a full day because of the shortage of space. From the economist's point of view, the real solution lies in attaining additional funds to meet the demand and this demand must be met without a decrease in quality which could circumvent completely the reasons for purveying education.

John K. Galbraith, noted for his writing geared for popular consumption, is most emphatic about the need for additional expenditure in education.¹⁴² He contends that in our past, entrepreneurship and other factors were most vital in our economic development. Present day needs are in terms of great numbers of trained and qualified people. He states:

Investment in human beings is prima facie, as important as investment in the material capital.
What is more important is the technical advances

¹⁴⁰Ansel Sharp & Bernard Sliger, Public Finance. The Dorsey Press: Combwood, Illinois, 1964, p. 323.

¹⁴¹Ibid., p. 323.

¹⁴²Gauerke and Childress, op. cit., p. 31

now almost wholly dependent on investment in education, training, and scientific opportunity for individuals.¹⁴³

Galbraith sees education as fitting into another aspect of economics. Reasoning that wants stimulate production, he contends that increased educational investment increases wants and consequently increases production to satisfy these wants. Simple modes of enjoyment need little preparation, but the more esoteric desires can be synthesized only by certain educational effort.¹⁴⁴

Edward Dennison has made recent attempts to appraise the social benefits of education. He studied the growth rate of the gross national product between 1929 and 1957 and the factors causing the growth rate. He identified positive factors which contributed 109% and the negative factors contributing 9%, making a net of 100%. He shows the increased inputs of labor and capital account for only 49 positive percentage points out of 109, or 45% of the total. Increased inputs of education and knowledge accounted for 43 percentage points out of 109 or 39% of the total.¹⁴⁵ Even more significant were his findings with respect to growth rate of the economy per person employed. His final estimate is that education contributed 42% of the 1.60 percentage point growth rate in the product per person employed.¹⁴⁶

¹⁴³Galbraith, The Affluent Society, Houghton Mifflin - Boston, 1958, p. 274.

¹⁴⁴Ibid., pp. 279-280.

¹⁴⁵Johns & Morphet, The Economics and Financing of Education, pp. 77n.-70.

¹⁴⁶Ibid., p. 79.

Another method of studying the benefits of education is to consider the cost of not educating people. The crime rates and the rates of dependency upon public welfare or private charity are many times greater among those without sufficient education to enable them to succeed in present day society than among those who have an adequate education. The direct cost to the taxpayer keeping a man in prison may range from \$3,000 to \$4,000 per year in terms of 1967 prices. This does not include the cost to the individuals of the crime committed or the social cost that may be incurred by the prisoner's family being forced on to relief.¹⁴⁷

In spite of the high standard of living enjoyed in the United States, relatively large numbers of workers are unemployed. Unemployment leads to poverty and a smaller market for consumer goods. A large portion of the unemployed are workers with relatively little formal education. The high school dropout finds it difficult to secure and hold a satisfying job. The relationship of low education and high unemployment reflects that the social cost of under education is likely to be concentrated in the future.¹⁴⁸ Improved education, therefore, is the hope of minimizing the unemployment problem.

Thomas Jefferson was the first to proclaim that a democratic society can function effectively only under an

¹⁴⁷Ibid., p. 81.

¹⁴⁸Gauerke and Childress, op. cit., p. 34

informed literate electorate. It appears, however, that the survival of the American free enterprise system requires more and better education than has been provided in the past.¹⁴⁹

Standards for Selecting Taxes

One of the major issues previously identified in the operation of public schools is how the operation should be financed. Taxes are designed to cover the cost of public services. It must be determined whether the tax payments are regressive, proportional, or progressive. Since they are to express the individuals' valuation of social wants as based on property distribution of income, the answer depends on the income elasticity of social wants. If this elasticity in the typical case tends to be unity, tax contributions will be proportional. If it is above unity, it will be progressive. If it is below unity, it will be regressive.¹⁵⁰

One of the major issues facing the financing of public schools today is the source of taxation. (In Chapter I, Sharp and Sliger list three standards to serve as criteria for selecting a good tax.) They are:

- (1) Equity
- (2) Efficiency
- (3) Adequacy¹⁵¹

Equity in taxation requires that a tax be just.

¹⁴⁹Ibid., p. 34.

¹⁵⁰Benson, p. 99.

¹⁵¹Sharp and Sliger, p. 196.

The term "efficiency" is a criterion to determine if a tax can be construed broadly or narrowly. The term as interpreted by Adam Smith means that a tax should be certain, convenient, and economical.¹⁵²

Though adequacy was not used by Adam Smith as a standard for determining a good tax, Sharp and Sliger make the following comment:

Given the two taxes equal in every respect, the one that brings in the greater revenue is the better tax and no matter how equitable and efficient a tax may be, if it fails to derive revenue, it usually has little justification for being levied.¹⁵³

The first of the major taxes to consider is the federal income tax. The basic structure of the federal income tax is simple. The taxpayer makes a summation of his taxable sources of income and then subtracts certain deductions and applies the tax rate to the difference. Federal taxation is a major device for seeing that our economy performs close to its potential output and does so without creating a high rate of inflation. Though the federal income tax is not simply an instrument to raise revenue for current public expenditure requirements, it still should be judged as a tax in terms of criteria of equity, neutrality, costs and yield.¹⁵⁴ With respect to equity the federal

¹⁵²Ibid., p. 201.

¹⁵³Ibid., p. 201.

¹⁵⁴Benson, The Economics of Public Education, pp. 101-102.

individual income tax is commonly regarded as the best tax we have.¹⁵⁵ With respect to neutrality, there has been some concern on what the effects a progressive federal income tax would have on work incentives and investments.

In dealing with the matters of cost and yield it is generally agreed that the federal income tax is economically and efficiently administered by the government. Walter Heller has stated: "The cost of collecting federal taxes is far below costs of collecting state and local taxes."¹⁵⁶ On yield, the consensus is that the federal income tax is our most productive levy and also that it is a tax of remarkably high elasticity of yield. In evaluating the federal tax relative to the criteria established in the principles of Chapter I, Sharp and Sliger would rate the federal income tax in the following way: equity--good, adequacy--good, efficiency--average.¹⁵⁷

The next major tax to consider is the state income tax. It is relatively neutral in the sense that it cannot be expected to have much effect on work or investment incentives.¹⁵⁸ The cost of compliance is considerably reduced when states use the federal concepts of taxable income. The income elasticity in state income taxes as it has been

¹⁵⁵Ibid., p. 102.

¹⁵⁶Ibid., p. 105.

¹⁵⁷Sharp and Sliger, pp. 200-210.

¹⁵⁸Benson, p. 106.

estimated is 1.389.¹⁵⁹ This is slightly below the elasticity of the federal tax. In rating the state income tax, the criteria marks would be: equity--good, adequacy--fair, efficiency--fair to good (varies in states). Peterson points out that this particular tax still has the greatest potential of untapped resources.¹⁶⁰

Another tax to consider is the state sales tax. The chief objection to sales taxation is its inequity. The tax is levied on consumption. Poor families consume larger portions of their income than do the rich. For this reason only, the sales tax would be regressive.¹⁶¹ Basically, the sales tax is a neutral levy. It covers a broad range of commodities and the rate levy is uniform over all goods. The tax is paid frequently in small amounts, therefore, the payments do not have the visibility to the household of either the income or property tax. Costs of the administration are estimated to be about one-half of one percent higher than those of state income taxes.¹⁶² Elasticity of yield is estimated to be in the order of 1.00 - 1.27 which is substantially less than that of income taxes. Sharp and Sliger evaluate the sales tax as poor in equity, good in adequacy, and average in efficiency.¹⁶³

¹⁵⁹Ibid., p. 106.

¹⁶⁰Peterson, pp. 52-53.

¹⁶¹Peterson, pp. 50-54.

¹⁶²Benson, p. 107.

¹⁶³Ibid.

The final tax to consider is the property tax. The property tax is based on the value of taxable property and is collected from owners of that property.

In no state is real property assessed on the average at current market value.¹⁶⁴ Benson feels that there is no reason to believe that fractional assessment increases inequities. With full value assessment, cases of inequity would be much easier for the taxpayer to detect and demonstrate to the authorities.

The impact of the property tax is on the owner of the property, as it is he who pays the tax bill to the tax jurisdiction.

Sharp and Sliger's evaluation of the property tax for school purposes is as follows:

- (1) Equity--with respect to equity it has long been recognized that the tax is probably regressive in incidence. The burden is distributed in a regressive fashion. The part of the tax which is levied on residential property is by definition a tax on housing expenditures. The percentage of income that households spend on housing is greater in low income groups than in high. The evaluation of the property tax therefore, is poor in the using of equity as a criteria.
- (2) Efficiency--the property tax is not difficult to administer. To administer it well, however, is another matter. Local administration is concerned mainly with the real properties. It is easy to see that the person who is to pay the tax because ownership is a matter of legal record. It is easy to determine in what district the property is in, therefore, jurisdictional disputes on tax sites are rare. It is relatively easy to forecast yields from one year to the next. These are real advantages in local

¹⁶⁴Ibid., p. 110.

administration. Assessment, however, is a complicated business, often beyond the capacity of local officials. In respect to cost of compliance, the property tax administrative expenses are practically nil. For the criteria of efficiency, the property tax rates below average with the potential to improve.

- (3) Adequacy--it is well to note that the property tax is available for emergency whenever bonds must be passed for such purposes. The real problem that faces educators and boards at this time is that the wealth of this nation no longer is concentrated in property, as it has been in the past. Relatively, the yield on the property tax is inelastic. It is estimated that the elasticity coefficient to be .82 which is considerably below the estimate for income and sales taxes. The evaluation of the property tax with the criteria of adequacy is fair.¹⁶⁵

Future Trends Affecting School Finance

Corbally estimates that financial needs for school costs in the 1970's will double over what existed in the 1960's.¹⁶⁶ It will be five percent or more of the gross national product as compared to less than four percent today.¹⁶⁷ Most of these funds must thus continue to come from the state and local governments, tuitions, payments and gifts.

If new school revenue is necessary, the question is "From where shall it come?" The property tax appears in most areas to be already carrying more than its fair share of the burden. State legislatures are reluctant to impose new taxes and yet are faced with increasing demands for

¹⁶⁵ Ibid., p. 299.

¹⁶⁶ Corbally, p. 14.

¹⁶⁷ Ibid., p. 147.

revenue for higher welfare programs as well as for schools. Corbally cites federal aid as a possible source.¹⁶⁸ Several bills relating the federal support of public education have been debated by Congress. New vocational bills and Public Law 89-10 (The Elementary and Secondary Act) have given some relief to the schools as has Public Law 874 for federally impacted areas. The uncertainty of these federal funds, however, makes it very difficult for administrators to plan effective school programs. The need, therefore, for a federal plan to subsidize the states for local school systems with consistency and reliability still exists.

100% State Support

Stanley Hecker, a member of the Committee on Educational Finance for NEA, endorses 100% state funding for the state of Michigan. In order to support the following proposition for a fully state funded educational program he makes the following specific points:

- (1) Our present funding plans are not meeting the American commitment of equal educational opportunity for all.
- (2) Local control is not necessarily a function of the degree of the local financing of education.¹⁶⁹

The basic plan for the state of Michigan would commit the state to this proposition: That the state is wealthy enough to pay for a good educational system for all boys and girls.

¹⁶⁸Ibid., p. 148.

¹⁶⁹Stanley Hecker, 100% of State Support--Boon or Bane, Committee on Educational Finance--NEA, 1970.

Despite the 100 percent state funding plan proposed in Michigan the local school districts would continue to make most educational decisions. The local district would select a local board of education which would appoint the district's chief administrator.

Planning--Programming--Budgeting
--A Systems Approach

Some writers in school finance foresee the probability that educational planning in the near future will be utilized to a great extent with the concept of planning, programming, and budgeting systems. PPBS is a synthesis of established techniques that is applied to the management and control processes to produce a program budget relating output-oriented activities of an organization to the input-oriented resources.¹⁷⁰

A properly implemented PPBS system will enable each school district to make available to board members and administrators more concrete specific data relevant for their broad decisions. It will spell out more concretely, the objectives of educational programs, and present for the boards possible alternative objectives and educational programs to meet those objectives. It will evaluate thoroughly the benefits and costs of educational programs by producing total rather than partial cost estimates and present on a multi-year basis, the perspective costs for anticipated accomplish-

¹⁷⁰ Harry J. Hartley, Educational Planning--Programming--Budgeting (New York, 1968), pp. 43-44.

ments of educational programs. The PPBS provides a new approach to an old problem, that of best utilizing the resources to improve the learning process.

Increased Federal Aid to Education

Perhaps the most controversial issue in the total American planning of our public school systems deals with increased federal aid to education. Many progressive steps have been taken in the past five years with additional school aid from Washington. The most debatable issue is how much federal control will follow federal support to the public schools.¹⁷¹ The problem that the public faces, however, is that the American people have taxed themselves as heavily at the local level to provide high quality education but more money is still needed. Recent changes have made it imperative that the federal government rely on its educational systems to help solve some of its problems such as poverty, unemployment, economic growth, common defense, and building unity of mixed cultures. National reliance in these matters makes the school system a stronger partner than ever with the state and local governments. Traditionally, the federal government's role in the partnership of public education has been a noncoercive and supplementary one. Most of the federal support has come to the schools in the form of categorical aid. Categorical aid, however, arbitrarily elevates

¹⁷¹Forest Conner AASA, Federal Policy and the Public Schools, American Association of School Administration, Washington, D. C., 1967, pp. 22-28.

some fields of instruction while downgrading other fields of equal validity. General aid is a more advantageous means for distributing federally collected revenues to school systems as they are more suitable to tie school support to the economic capacity of the nation. Proponents of general aid express the need for this type of support in two forms: (1) general grants-in-aids, and (2) tax or revenue-sharing.¹⁷² Tax-sharing actually comes closer to expressing the fundamental role of the federal government. By this method its action is restricted to purely fiscal relationships with the state. It would serve as the means to gear a basic support of education to the total economy of the nation.

There are still many pertinent questions to be answered about the increased federal role in education. It remains, however, a fact that increased federal payments to public schools are necessary and inevitable while specific purposes of these payments and the controls that accompany them will reflect changing national concerns.¹⁷³

Extended School Year

Another innovation that may affect the future trends in school finance is that of the extended school year. It offers many possibilities. The extended school year would alleviate over-crowded classrooms, decrease needs for additional building space, reduce juvenile delinquency

¹⁷²Ibid.

¹⁷³Ibid.

potential, and provide opportunity for extended contracts with other fringe benefits for teachers as well as the opportunity to improve instruction.

To the taxpaying citizen, or anxious parent, the year-round school offers best utilization of school plant, administration, outlay items, teaching staff, and educational programs.¹⁷⁴

Facts and Statistics About Kansas

The ability of a state to support education depends upon the nature of the state's economy. The diversity of a state's economy and changes in the composition of its occupations may indicate the kinds of modifications, if any, that may be needed in the tax system to provide the most equitable distribution of the cost of education among its citizens. The level of income and the general stability provide a basis for estimating the economic capacity of a state to support education.

For these reasons, it is important to understand the nature of the economic resources in order to evaluate the cost of education that is desirable in relation to the tax-paying ability of the state.

Table III is a comprehensive set of details about Kansas public education. This information was provided by the Kansas State Department of Education.¹⁷⁵ Table IV, "Where Kansas Ranks: 1970," offers a set of statistics that can be used to give a strong indication of Kansas' position

Data obtained from "Rankings of the States,"
1970, Research Division, NEA.

for the State of Kansas. These data were provided by the Research Division of the Kansas State Teachers Association.

An analysis of the statistics in Table VI show Kansas to be only slightly below the national average in per capita income. The economy of Kansas is a well-balanced one, with considerable variation among areas in the state on the sources of income and occupational activity. A major problem for financing public schools in Kansas can be placed with the heavy reliance on the property tax. Less than a third of the support is provided from state taxes. Kansas government functions with a broad tax system which includes property, sales, and income. A persistent problem of taxation involves equity and the distribution of the burden among the three sources. The adequacy to support essential functions of government has also become a problem. It therefore appears that state funds will have to bear a larger proportion of future costs.

Kansas, in past years, has spent considerably more than the national average for public education in proportion to its income.¹⁷⁵ This expenditure, however, has declined slowly in relative effort to the national average and Kansas' educational expenditure per pupil is now below the national average. Since 1955 the average annual national growth rate has been 9.5 percent over each preceding year, while the Kansas rate has been 7.9 percent.¹⁷⁶ It is questionable

¹⁷⁵National Educ. Assn. and Kansas NEA, op. cit., p. 119.

¹⁷⁶Ibid.

whether Kansas offers adequate economic opportunity for professional advancement and career commitment to serve in the public schools. A further review of Table VI shows that while Kansas per capita income is 97 percent of the national average, the average teacher's salary in Kansas is 88 percent of the national average. The average salary for Kansas teachers is \$7,620 compared to the national average of \$8,560. While Kansas ranks 22nd in per capita income, it ranks only 31st in average teacher salaries.

Summary

The basic questions creating a controversy in most states are: (1) what should be accomplished through the public schools, and (2) how much should the public school program cost, and (3) how should it be financed? It is easier for most people to see a relationship between quantity and educational expenditures than between quality and cost. Increasing quality likely increases the costs but there is no certainty that increasing the cost will improve the quality.

In the past it has been accepted that the best measure of the ability of the people was the per capita wealth represented by the value of tangible property. The measure of ability now most commonly used is personal income. Reliable data are now available to determine per capita income at all levels of government including some school district boundaries.

It appears that the state income tax is still the best source for new tax revenues in most states. Schools in Kansas however depend more heavily on local property taxes than in most other states, so this tax is being re-examined. The ultimate test of the school finance program is not the number of dollars it provides the school district but rather the degree to which it creates opportunities for the production of excellent educational goods and services.

Criteria to be considered in evaluation of a school foundation program include: funds from both state and local sources for every school district, uniform minimum local effort for financing education, local initiative to provide educational opportunities beyond minimum standards, encouragement of sound and efficient organization, and capability for easy public understanding.

There are variations in school expenditures between communities for two reasons: (1) the communities vary in ability, and (2) the communities vary in vigor of local support.

The first step in developing a satisfactory foundation program plan is that of establishing objective, equitable, and valid measures of educational need.

State aid patterns are (1) flat grants, (2) flat grants and special aids, or (3) the equalization need and ability considered with or without flat grants or their equivalents in minimum guarantees.

A foundation plan distinct from other states is that of California. This plan employs three fixed unit equalization

grants for the elementary districts, secondary districts and unified districts.

The Washington plan reveals another progressive advancement made in school foundation finance. Approximately 75% of non-federal revenue for public schools is provided through state grant distributions. A distribution formula provides for a guaranteed equalized amount from state and designated local funds.

The Florida plan includes a number of instructional units based on average daily attendance and varies with the training and certification of the teachers employed in the country. Additional allocations are provided for current expense, capital outlay, and transportation.

A very constructive contribution to educational research, The Peterson Model, was completed at the University of Wisconsin under the direction of Leroy Peterson. It involved educational and financial analysis of six types of school districts in each of four states. While the formula may be used to advantage over many existing formulas for schools, its greatest potential is the changes in education that it makes feasible.

Since the implementation of the present Kansas foundation program there have been many arguments directed against the distribution formula. Controversies center around the economic index which places an element in the distribution formula at the county level.

Education is one of the most thoroughly political enterprises in American life. More money is spent for education than for any other single function of state and local government. The largest obstacle to state support of public schools comes through the political process.

Education may be viewed as an industry, one in which resources are used to produce given products and services. As a change from past economical views, modern economists now are increasingly accepting the notion that education is an investment.

One of the greatest issues of the financing of education of public schools today is that of the source of taxation. The relative merit of the tax can be judged by three rather broad standards: (1) equity, (2) efficiency, and (3) adequacy.

The cost of the educational program in the next decade appears to be prohibitive. The expected expansion in the total economy, however, should be able to support such a program without strain if the tax load is equitably levied. It is estimated that the financial needs for school costs in the 1970's will double over what existed in the 1960's. The crucial problem that will face school administrators will be the search for new funds. The property tax appears in most areas to be already carrying more than its fair share of the burden. Increased Federal aid and federally shared taxes have been cited as possible sources. Some states still have the state income tax as an untapped resource, or they may

not be utilizing their present revenue source to its full potential.

Future trends in education that may effect the planning of school finance are planning programming budgeting systems, and the extended school year.

Local control is threatened by 100% funding by the state as well as increased federal support to education. Increased funding at both levels, however, appears inevitable if our public school systems are to progress and meet the increasing demands placed upon them by society.

Kansas is slightly below the national average in per capita income. It ranks, however, lower in educational expenditures per pupil than it does in per capita income per pupil. The same situation exists with teachers' salaries in Kansas compared to the national average.

One of the most crucial problems facing the financing of Kansas public schools is the heavy reliance on property tax. It is therefore imperative, that state funds will bear a larger proportion of future costs.

CHAPTER III

PRESENT SCHOOL FOUNDATION PLAN IN KANSAS

Kansas, like other states, supports its public schools from local, state, and federal tax revenues. The local funds are mainly taxes on property levied by the local school districts and the counties. The state funds are mainly sales and income taxes distributed from the general fund. Federal funds are aids that are granted for particular programs or special programs.

The present foundation finance plan for public schools of Kansas was implemented by the Kansas Legislature in 1965.¹ The implementation of this plan resulted from a series of proposals to increase state aid. The original goal was for the state to guarantee 40 percent support to each school district. The Kansas Foundation Finance Act which provides a state shared guarantee, is composed of state foundation aid and funds from local districts and counties. This was indeed a big step forward for school finance in Kansas.

The Foundation Formula

With the exception of a few special state funds, the foundation program is that portion of the state plan of

¹National Education Association and Kansas State Teachers Association, A Statewide Study of Educational Conditions and Financial Support, Topeka, Kansas, January, 1968.

school support through which state funds are provided.

The foundation program is defined as a state shared guarantee which is computed from an objective formula as follows:²

$$\text{State Shared Guarantee} = \$760 \times \text{Number of Certificated Professional Staff} \times \text{A Pupil-Teacher Ratio Factor} \times \text{A Training and Experience Factor}$$

The training and experience factor has a limit of ten points, seven for each teacher with 210 semesters of college credit and three for 15 years of educational experience. If all staff members had 210 hours of college credit and 15 years of experience the district would be guaranteed a foundation of \$7,600 per staff member employed, provided the district had a pupil-staff ratio of not less than a specified minimum for given size categories. The scale of weightings for pupil-staff ratios is as follows:

1. Under 1,000 pupils	15
2. 1,000 - 1,999	16
3. 2,000 - 2,999	17
4. 3,000 - 3,999	18
5. 4,000 - 4,999	19
6. 10,000- 9,999	20

If a district employs staff in such numbers as to reduce the ratio below the minimum, the factor is reduced proportionately. For example, if a district has 600 pupils and

²Kansas State Teachers Association, Kansas State and County School Finance Programs (Topeka, Kansas: June, 1969), p. 3.

employs 40 staff members it has a ratio of 15. If it employs 50 members its ratio drops to 12 and it then becomes a factor of $12/15$ or 0.8. This number multiplied by 50 yields 40. Thus, the costs of staff members beyond the number required to meet the prescribed pupil-staff ratios are borne entirely by the local district.

For official enrollment count a district sending a pupil to an area vocational-technical school may count him as a full-time pupil if he attends the home school at least one-half time. A kindergarten pupil is counted as one-half a pupil.

The training and experience factor averages about 6.6 for the whole state. Therefore, if all districts had a pupil-staff factor of 1.0, the training and experience factor would allow only .660 times the number of staff times \$7,600 or a foundation level of \$5,016. Kansas actually has a foundation program with a theoretical maximum of \$7,600 per professional staff member. This unit is commonly called Instructional Unit in states that use the professional staff rather than the pupil as the unit of cost of the foundation program.³

Table V shows the data for computing the Kansas Instructional Units in the foundation program for a sample of districts. The first example, Mullinville, employed 21 staff members but it received only .393 times 21, or eight

³Ibid.

Instructional Units. Its foundation program of state and locally shared support was 8 times \$7,600, or slightly more than \$60,800.

Distribution Formula

The method of computing the guaranteed foundation allowance is a major consideration for study. Another consideration is the method used to compute the state aid or the state's share of the foundation cost. The formula for distribution for foundation funds is as follows:

Source: State general fund

Distribution: The basic formula is:

$$\text{State Aid} = \text{State-Shared Guarantee} - \text{Non-District Revenue} - \text{Local Effort}$$

The amount of state aid is the remainder after subtracting two amounts from the computed foundation allowance: (1) certain designated non-district revenues, and (2) an amount computed as "local effort."

The "local effort" of a district is based on a county economic index. Each county index is equal to one-half of the sum of: (1) adjusted assessed valuation of tangible property plus (2) taxable income in the county. This index is averaged for the two years preceding the school fiscal year to which it is applicable.

County School Foundation Fund

The county foundation fund is first divided on the basis of the total enrollment in the county on September 15. This determines the per pupil share. There is allotted to the board of each district which has some territory in the county but which is not a district in the county, an amount equal on the per pupil share multiplied by the number of pupils residing within the county. The money that remains in the county foundation fund is then distributed to districts within the county on the basis of the number of certificated employees employed in attendance centers within the county.⁴

County Index

The county index represents the share which the districts of each county must contribute as the local share of the state guarantee, equal to the yield of a ten mill levy on all adjusted assessed valuation of tangible property of the preceding year. The county's portion of the total local share in the state is then divided among school districts according to the number of certificated staff members employed.

The use of the county index which combines income and assessment of property is one of the most questionable features of the Kansas finance plan. The effect of equal weighting of income and adjusted valuation penalizes the property owners in districts where the ratio of income to

⁴Ibid., p. 7.

property is greater than the average for the state and it rewards those districts where this ratio is less than the state average. This effect can be illustrated very simply since the total adjusted assessed valuation of property in the state and the taxable income are nearly equal. An example is to assume a district has \$59,000,000 of adjusted assessed valuation of property and \$65,000,000 of taxable income as estimated from the county index. The average of these two figures is \$62,000,000. A ten mill levy on the difference of \$3,000,000 equals \$30,000. This is the amount of state aid that the district loses as compared with an index of local ability based only on the \$59,000,000 of adjusted assessed valuation of property. One effect of this arrangement is to shift some of the burden of equalization of the cost of the foundation program from the state to the county level.

Another effect of the county economic index is to penalize districts that improve the numerical adequacy of staffing in the schools. If there are three districts in a county, A, B, and C, and each district employs 50 staff members and each has the same amount of assessed valuation of property, then District A may decide to employ five additional teachers. Its share of the county index yield changes from 33 1/3 percent to 35.5 percent and its state aid is reduced accordingly. Since its property assessment remains fixed, it now has 10 percent less local taxing ability to support each staff

member above the state foundation than it would have with only 50 staff members.

Budget Control

No district may budget or expend for operating expenses more than 104 percent per pupil of the amount legally budgeted per pupil for the preceding school year. There is one exception: districts with an enrollment decrease of less than 10 percent shall compute the 104 percent limitation on the basis of enrollment of the preceding year.

There are twelve items not included as operating expenses in computing the 104 percent restriction. The most common expenditures not considered in the computation of the 104 percent restriction includes bonds and interest and non-fund warrants, special building funds, payments to another district in an adjustment of rights upon annexation of transfer of territory, food services, and student activities which are reimbursed, and certain federal funds not required to be budgeted before expended.

Appeals to exceed the 104 percent limitation on a per pupil basis may be made to the State Board of Education. The Board may authorize budget increases to exceed the 104 percent per pupil limitation for one or more of these reasons:

- (1) Unusual occurrences affecting enrollment.
- (2) Level of training and experience of teachers is below the state average.
- (3) The district's PTR is higher than the state average in comparable districts and limitation will not permit improvement of that ratio.

- (4) The district has a salary schedule below the highest salary schedule of all districts in the same enrollment classification, and the limitation will not permit the district to increase its schedule to the comparable, to the highest one in its enrollment classification. The enrollment classification of districts: less than 500 pupils; 500 to 1,000; 1,000 to 2,500; 2,500 to 5,000; 5,000 to 10,000; 10,000 or more. The State Board of Education determines the highest salary schedule for each class of districts. Increases allowed by the Budget Review Board cannot exceed 4% of the amount legally budgeted for operating expenses per pupil the preceding school year. (This amount is in addition to the regular 4% authorized by the foundation act.)
- (5) Additional costs arising out of unification, consolidation, or substantial change in territory.
- (6) Construction of new or additional school facilities which causes an increase in operating expenses per pupil greater than the district can make under the limitation without impairing the educational program.
- (7) Initiation of a kindergarten or junior high school program.
- (8) Expanded costs of pupil transportation growing out of unification, substantial annexation of territory, closing of attendance centers, or meeting safety standards for bus equipment.
- (9) Increase in salaries required by the Federal Wage and Hour Law.
- (10) Initiation or expansion of approved special education programs.
- (11) Implementation of any new programs required by statutory directive the cost of which cannot be met under the limitation without impairing the educational program.
- (12) Additional costs arising out of establishing and operating elementary school libraries.
- (13) Additional costs from continued operation of Title III programs.
- (14) Additional costs arising from closing non-public schools.

- (15) Districts under 10,000 enrollment which have per pupil operating expenses less than 90% of the state average.⁵

In lieu of an appeal to the Budget Review Board (State Board of Education), a district may budget and expend more than 104 percent limitation if the proposition is submitted to the voters in an election and receives a majority of the votes cast.

Unification

Another important act, the School Unification Bill, reduced the number of school districts from approximately 2,000 in 1963 to 310 at present.⁶ The combination of unification and the foundation program gave relief to the property tax in 1965 but for a period of one year only. The combination of inflationary costs with no increase in appropriations for the foundation program has caused the level of state support to change from 38.5 percent in 1965 to less than 29 percent in some districts in 1969.⁷

Supplementary Aid

In recognition of the serious problems confronting school finance, the 1969 Legislature implemented an additional \$26 million to the present foundation program. In 1970 this became a permanent appropriation. The additional aid was

⁵Ibid., p. 6.

⁶National Education Association and Kansas State Teachers Association, p. 1.

⁷Ibid.

distributed by pupil units modified by the assessed valuation.

Tax Lid

Due to mounting pressure from tax protesting organizations, the 1970 Kansas Legislature passed a new bill creating a tax lid on all property for all governmental units.

All provisions previously stated on 104% limitation and the appeals procedure are now temporarily replaced by the tax lid for at least two years. Kansas schools may now increase their budgets only to an amount of 105% of the previous budget. This is not on a per pupil cost basis but constitutes a total budget figure. When the tax lid is lifted, the original provisions will be reinstated unless changed by statute.⁸

Comparison of Distributions by Counties

In 1967 Dr. Francis Woodward of Wichita State University made a study of the school foundation fund redistribution pattern and the revenue paid into the general fund by the various counties. The economic index, which is a key variable in the present formula, is established on a county level for all school districts within that county. Dr. Woodward's thesis was as follows:

The redistribution flow of amounts paid into the General Fund and allocated through the School

⁸Kansas Legislative Council, Research Department, Summary of House Bill 1825 (Topeka, Kansas: March, 1970), p. 5.

Foundation Program tends to be from the more populated counties with somewhat of an urban base to the lesser populated counties.⁹

His methodology was as follows: for each county, calculations were performed to derive the percentage contribution to the General Fund and the percentage allocation from the school foundation fund. These figures were then compared to see if a particular county was receiving more than it was paying percentage-wise. Table VI lists the top ten contributors and Table VII lists the top eleven allocations from the school foundation funds by counties. Table VIII gives a comparison of the redistribution of the top twenty counties, listing the differential percent-wise of allocation and contribution by counties.

The conclusion of his study shows that the available data substantially confirms his thesis. Deductively, it is reasonable to assume that the more populated counties are the largest contributors to the general fund and that these same counties receive the largest allocations from the School Foundation Fund. The inductive evidence reinforces the deductive reasoning while also pointing out that many of these larger counties have percentage contributions which are greater than the percentage allocations they receive.

Comparison of State Aid Allocation,
Ad Valorem Tax, and Taxable Income
by School Districts in Same County

Dr. Woodward's study proves some validity of the present foundation plan on a county basis. Further examination, however, of local mill levies, district allocation per pupil, and taxable incomes per district reveal inequities between school districts of the same county. Table IX through Table XIII give a comparison of districts within the same county relative to enrollment, state allocation per pupil, general mill levy, and taxable income per pupil. The five counties were selected by random sampling.

The statistics in Tables IX through XIII reveal that some districts within the same county show a significant difference in mill levies while their state allocations per pupil are approximately the same. A similar situation exists when comparing taxable income per pupil for districts who receive almost identical allocations on a per pupil basis. In Table IX attention is called to the Wichita Unified School District which receives \$3 per pupil above the average allocation while maintaining a taxable income of \$852 per pupil above the county averages. Other Sedgwick County districts receive less state aid per pupil than Wichita but maintain a significantly lower taxable income than the county average. Maize, Goddard, and Clearwater are such examples. Comparisons with other districts of Sedgwick County can be made relative to mill levies versus allocation. Haysville has a mill levy of 47.39 mills compared to a 19.43 mill levy for Andale.

Source: Statistics, Kansas State Department of Education

Haysville receives, however, allocations greater than that of Andale by only \$8 per pupil. The taxable income per pupil for each district is identical.

In Table XII a very significant inequity exists between the allocations to El Dorado and Rose Hill. El Dorado receives \$259 per pupil while maintaining a taxable income per pupil of \$5,272 with a mill levy of 25.69. Rose Hill receives \$217.43 per pupil, maintains a taxable income of \$1,906 but levies 44.03 mills. Special attention is called to Doniphan County illustrated in Table XIII. Doniphan County is a rural area. Elwood receives \$313.95 per pupil in state aid which is \$28.36 above the average allocation of the county. The taxable income per pupil, however, is \$1,405 below the county average. The levy of 43.24 mills is 11.78 mills above the county average. The citizens of Elwood are making a greater sacrifice for the same quality of education that prevails in the other districts of the county. The only measurement for criteria of quality in this case is expenditures per pupil.

Evaluation of the Foundation Program

The final analysis can be made for the present foundation program by evaluating the plan as it now stands with each of the twelve principles established in Chapter I. The first principle indicates that the financial support of public education should be shared by all citizens and all levels

of the government. The present foundation plan does concur with this principle.

The second principle states that Kansas should assume a greater responsibility of support for public education and recommends 50% state support. State aid in 1969-70 amounted to 32%.

The third principle states that the measure of the local school district's ability to pay should be in terms relative to both the property tax and the local economic index of personal income. The present foundation program gives no consideration to local tax base whatsoever. The economic index is established at a county level and research reveals many inequities among districts within the same county.

There are no indications of any discrepancy between the present foundation program and the fourth principle which recommends the continued fiscal independence for boards of education. This principle also recommends a minimum local effort of at least ten mills. There were only three districts in 1969-70 maintaining less than a ten mill levy in Kansas.

The fifth principle recommends state support be directed by the state's per capita income relationship to the national average. Kansas at present falls within the linear correlation of the two variables but its expenditures place it below the average level.

The sixth principle recommends an inverse relationship to exist between allocating per pupil and assessed valuation per pupil. This principle is not in practice at present.

The seventh principle recommends that variables of local ability to pay be established in terms of assessed valuation, taxable income, size of school, professional training and experience of teachers, and pupil-teacher ratio. The present foundation's formula does not contain the elements of assessed valuation or school size.

The eighth principle recommends that aid for transportation be excluded from the foundation formula. Transportation is not part of the present foundation program but is maintained separately.

The ninth principle recommends that budget planning be directed by projected enrollment. This is now a current practice with the present plan. The membership, however, is reflected by an official count of one day.

The tenth principle recommends a good tax to support education. The established criteria for a good tax are equity, efficiency, and adequacy. The present school finance plan in Kansas relies heavily upon property tax to support education. As property is no longer the chief source of wealth and because the property tax is presently overused, it can no longer be considered a good tax. The present plan does not concur with this principle.

The eleventh principle recommends the provision in the foundation program for expenditures toward capital outlay and textbooks. There are no provisions for either program.

The twelfth principle recommends that a unified district must have at least 150 pupils (K-12) to qualify for the

foundation plan. In 1969-70 seven unified districts in Kansas with enrollments smaller than 150 received some state aid.

Further Criticism of the
Present Foundation Plan

"The present foundation formula is essentially a flat grant."¹⁰ State Department statistics reveal that 92% of the school children in Kansas reside in school districts that receive \$50 plus or minus the median of \$172 during the 1967-68 school year from the present state finance plan.¹¹

Table XI further reveals inequities in wealth and levies with the foundation program. The distribution of funds not only shows lack of equalization but it denies equal educational opportunity for some students in Kansas. Some districts must endure extreme hardships if they are to provide their students with the same level of education as the richer districts. Experience shows that even though districts do give an increased effort in poor areas, it is highly probable that their programs will still be inferior to those of the rich districts.

The Kansas Association of School Boards Finance Committee evaluates the criteria of quality variable as follows:

The criteria of quality variable within the present formula creates two factors: (1) the administrative burden both at local and state levels is excessive, and (2) the COQ variation between districts is not very significant in terms of time and effort required to compute the criteria of quality. The theoretical limits of the criteria

¹⁰KASB Finance Committee, Report of the KASB Committee on School Finance to the KASB Delegate Assembly (Topeka, October 26, 1968), p. 1.

¹¹Ibid., p. 2.

of quality for school districts ranges from 4 to 10, however, for 1970 all districts were within a range of 5.50 to 7.49.¹²

The present method of increasing state aid is to increase the \$760 multiplier. This method, however, increases the difference between the various levels of training and produces a greater divergence between state policy and local practice.

Nationwide, the cost of education has been rising at the rate of 9.5 percent per pupil per year from 1955-56 to 1965-66.¹³ In Kansas the rate is 7.9 percent. The 104 percent increase limitation in per pupil expenditure forecasts a continual decline for Kansas public schools relative to the national average. This practice is contrary to the actual experience in terms of increasing expenditures both at the state and national levels. Any uniform percentage increase is inequitable as school districts vary widely in current budget circumstances.

Summary

The foundation program of Kansas is that portion of school support through which state funds are provided. It is defined as a state guarantee which is computed by multiplying the variables of the formula and subtracting local

¹²Ibid.

¹³National Education Association and Kansas State Teachers Association, Statewide Study of Educational Conditions and Financial Support (Topeka, Kansas: January, 1968), p. 75.

effort. The unit of measurement is the instructional unit which is modified by professional training and experience, and pupil-teacher ratio. A perfect unit constitutes a grant of \$7,600. Local effort is based on a county economic index which is equal to one-half the sum of adjusted assessed valuation of tangible property plus taxable income in the county. The county index represents the share which the districts of each county must contribute as the local share of the state guarantee. Its yield results from a ten mill county-wide levy.

The inequities of the present financial plan for school support can be summarized as follows:

1. The method of computing the cost of the state shared guarantee does not provide an equalized foundation of financial support.
2. The state shared guarantee is too low to enable the districts of less than average local taxpaying ability to reach an adequate level of support.
3. The financial plan does not provide adequate incentives for reorganizing inefficient local districts into more efficient units.
4. The present budgetary limitation of 4 percent per pupil increase over the previous year's budget is a questionable control over education.

Strong indications are that the present foundation plan in Kansas is failing to meet the adequate needs within

Kansas' elementary and secondary schools. This rationale provides the basis of initiating the development of a new plan that will offer equalization to all school districts in Kansas.

CHAPTER IV

THE PROPOSED SCHOOL FINANCE PLAN FOR KANSAS

As the individual elements of distribution formulas are studied, it is important to recognize that the crucial problem will be the combining of these elements into an appropriate program.¹ Even more important is the constant recognition that revenue for school purposes is raised to purchase factors of production which will provide educational goods and services. The ultimate test of the school finance program is not the number of dollars it provides a school district, but rather, the degree to which it creates opportunities for the production of excellent educational goods and services.

The objectives and goals of the school finance plan are defined in three phases: (1) increased expenditures at the state level, (2) distribution of funds to each school district with equalization based upon need, ability, and effort, and (3) shifting of the tax structure in order to provide necessary revenues for school financing from sources that are equitable, efficient, and adequate.

The additional revenue for the public schools in Kansas is definitely needed in order to provide educational programs

¹Corbally, p. 60.

that meet the needs of all pupils in grades K-12. Research provided by the Legislative Finance Committee and the Kansas Association of School Boards shows a need for an increase of \$25 million from the 1969-70 school year to be spent for education in Kansas in 1970-71.²

In order to reach the objectives as stated in the three phases, it is necessary to establish subobjectives for the development of means toward this accomplishment.

Subobjectives

(1) The finance plan will provide a minimum of 50 percent state aid for all schools in Kansas with the exception of wealthy districts. A wealthy district is defined as a school district with an assessed valuation per pupil equal to twice that of the state average AVP and whose taxable income per pupil enrolled in public schools exceeds the state taxable income per public school student. Provisions will be made in the foundation program to provide adequate state allocations which supplemented by local effort will guarantee for each school district, expenditures equal to national average costs per pupil. This guarantee will be modified by the relative position of Kansas per capita income to that of the national per capita income.

(2) Provisions in the finance plan will provide a system for rewarding school districts who choose to employ

²Kansas Association of School Boards, Research Bulletin 1970-71 No. 1 (Topeka, Kansas: August, 1970), p. 4.

teachers with superior professional training and experience. For districts that choose to employ staffs with excessive or extremely small pupil-teacher ratio, there will be an established system of rewards and penalties. The goal will be to work toward optimum efficiency with guidelines provided.

(3) Provisions will be established to reward school districts for extra local effort. No district, however, will be eligible for state incentive grants unless an established minimum local effort is made. State incentive grants will be allocated on a percentage equalizing basis. Districts defined as wealthy districts will not be eligible for state incentive aid but will have the option for local incentive aid.

(4) Provisions will include an option of the people of each school district to finance their schools by a choice of the property tax or by a nonproperty tax such as the local earnings tax.

(5) Provisions will establish a protection for the local property taxpayer in the form of a tax lid, which places limitations on both general levy and local incentive effort. It will be necessary, however, to permit wealthy districts to operate with a higher tax lid as their share of state support will require more local effort.

(6) The finance plan will consist of allocations appropriated at state, county, and local levels based upon the principle of equalization.

(7) Provision will be made to eliminate all levies other than the general operating levy, incentive aid, social security, and bonded indebtedness.

(8) The foundation program will be structured not only to maintain local control but to provide for increased state support. Each district will have the choice to operate at a level equal to, above, or below national standards. Districts who desire school budgets in excess of limitations may approve supplementary expenditures by a majority vote of the citizens.

(9) Provisions will be made for categorical aid to fund specific supplementary programs for each school district.

(10) Budget capacity will be developed by a unit of measurement that is flexible, simple and equitable.

(11) The finance plan will be financed by a "good tax." Sharp defines a good tax as one that satisfies the standards of equity, adequacy and efficiency.³

(12) Provisions in the formula will provide variations in school enrollment and for variations in wealth of each district. The wealthy districts will be given the option to exceed property tax limitations if necessary in order to increase their previous budget to the present statutory limitations.⁴

³Sharp and Sliger, p. 196.

⁴Kansas Legislative Council, p. 5.

Models for Decision Making in School Finance

The development of a new distribution formula for the purpose of allocating state funds to the public schools constitutes far more than a mathematical problem. R. L. Johns, in his article, "Dimensions of Educational Need," offers three models for decision making that may be helpful toward the development of a framework for a new finance plan.⁵

Figure 3 is a model that may serve as an aid for primary decisions. Figure 4 is a revenue dimension model, and Figure 5 is an allocation dimension model. The summation of the three models provides assistance for the selection from numerous alternatives made available through the study of school finance.

The Proposed Foundation Program

A review of literature reveals a variety of alternatives in which to select elements for a defensible foundation program. The proposed finance plan is designed to provide allocations for current expense and is divided into three phases. The first phase is referred to as the foundation program. The second phase is the incentive program, and the third phase is categorical aid. The foundation program is operational at both state and county levels.

⁵Kern Alexander, R. L. Johns and Richard Rossmiller, "The Implications of the Dimensions of Educational Need for School Finance," Dimensions of Educational Need, National Education Finance Project, Ch. 9, Vol. I (Gainesville, Florida, 1969), pp. 223-225.

Primary Allocations Dimension Decision	Primary Revenue Dimension Decisions	Whether or not to Levy Local Tax	Extent to Which Taxes will be Federal, State or Local	Rates to be Applied on each Tax
Measure of Educational Need				
Programs to be Offered				
Application of Cost to Programs				
Fiscal Ability And Effort

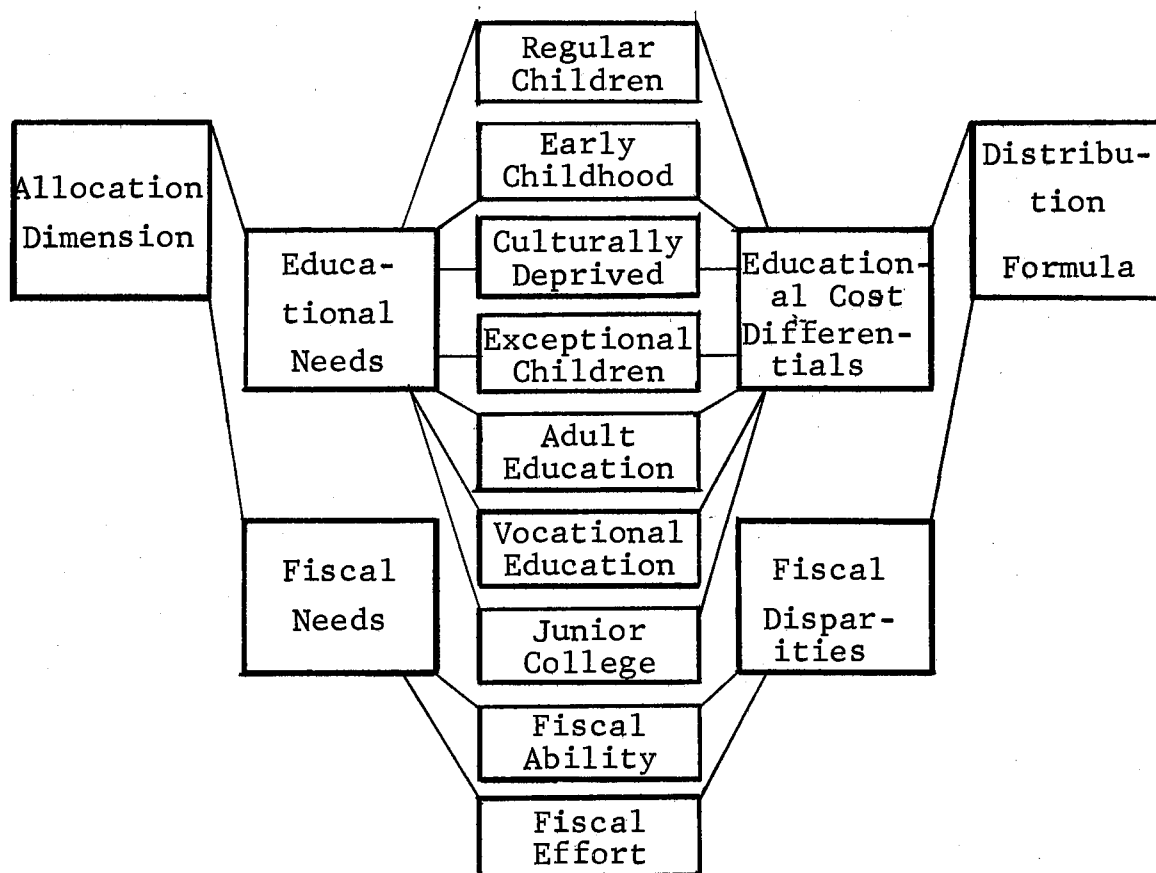

Figure 5. Allocation Dimension Model

Source: Johns, Alexander and Rossmiller, Dimensions of Educational Need, p. 224.

As all districts in Kansas are now unified with a K-12 organization, it is not necessary to impose any restraints because of district organization.

Framework for a Distribution Formula

The second principle in Chapter I recommends increased state responsibility for support of public education. The foundation program will provide at least fifty percent state aid except for those districts defined as wealthy. Benson's study as illustrated in Figure 1 proves a correlation to exist between state per capita income and school expenditures in 41 states. Benson's hypothesis will serve as a criterion for establishing the standards for educational expenditures that the state of Kansas will support. Statistics from the Research Division of the Kansas State Teachers Association show the per capita income of Kansas to be 97 percent of the national per capita income average.⁶ School Management of January, 1970, shows the national average expenditure to be \$673 per pupil during the 1969-70 school year.⁷ Through the utilization of these two variables, the foundation program will provide support for a guaranteed cost per pupil of 97 percent of \$673 or \$652. The state foundation program does not advocate a flat \$652 grant per pupil, but it will allocate state funds which, supplemented by local effort and the

⁶NEA-KSTA, Where Kansas Ranks, p. 16.

⁷Doherty, James E., ed., School Management, Clinton, Iowa, January, 1970, p. 42.

county foundation program, provides a guarantee of \$652 per pupil. Local boards will have the option to spend more or less than \$652 per pupil. The total guaranteed expenditures to be supplemented by state support will vary annually with the relationship to the two variables.

The foundation program will display some characteristics of the Rhode Island and Wisconsin plans. Although the state support will not be on a proportional basis as in Rhode Island, the districts in Kansas will be rewarded in respect to effort made by the local board.

The foundation program will reveal similarities to the Strayer-Haig-Mort Model, in the following manner. The total budgetary power of each district through the equalization process is computed. A deduction equal to a mandated minimum levy on equalized valuation is made. The difference is then provided for from state funds.

The concept of the flat grant per pupil as suggested in the second formula of R. L. Johns is reflected in the second principle which recommends that at least one-half of the educational expenditures be provided by the state. Exception will exist in wealthy districts.

Johns' fourth formula on equalized matching also contributes a similar concept for the incentive aid formula.

The framework for the foundation program consists of the three major elements: educational need, local ability, and local effort.

Measurement of Need

The first variable to consider for the foundation program is the unit of educational need. This foundation plan uses the pupil unit as a measure of educational need as recommended by Peterson.⁸

Larry Burdick, who selected the pupil unit in his proposal for a foundation program in Oklahoma, feels that the effects of the present programs in Oklahoma and Kansas make it desirable to develop a plan which emphasizes revenue needed to provide additional educational opportunities for students. The pupil unit also provides a method that can very easily be converted into a classroom unit approach. It is therefore possible to approximate very closely the results of using the classroom unit approach from the findings derived from the new distribution formula. The pupil unit also provides the simplest basis for the distribution of state funds.

The formula pertains only to those pupils enrolled in the public schools (K-12). Kindergarten pupils are considered one-half students. Senior high students participating in an area vocational school will likewise be considered one-half students. As recommended by Morrison the students in private schools are not a factor in the foundation program. Morrison describes what he calls a "hidden burden" on the part of students in the private sector.⁹ In districts

⁸LeRoy J. Peterson, Economic Impact of State Support Models on Educational Finance (Wisconsin, 1963), p. 48.

⁹Morrison, p. 9.

where there is a high enrollment in the private schools, it may affect the distribution and actually increase the allocations of those particular districts. The allocations, however, to districts with fewer private school students will be decreased.

Average daily membership will be projected from the past year's membership with provision for an adjustment to be made at the end of the first semester. The State Board of Education will approve projected membership for each district on the basis of past memberships. The State Board will permit a small degree of error, dependent upon the size of the district's membership and provide appeal procedures for districts that over-project or under-project.

The flexibility of the formula places no restraint of expenditures on any school district. The openness of the foundation program creates the feasibility to exceed expenditures of \$652 per pupil, however, some districts may find it possible to operate their districts with an adequate program at a cost less than \$652 per pupil. Statistics reflect a wide variation in present expenditures within Kansas schools. In the 1968-69 school year, the cost of operation per student ranged from \$448 to \$1,598.¹⁰ These data, however, do not reflect an evaluation of the equality of programs being offered in each district.

¹⁰Kansas Association of School Boards, Research Bulletin 1970-71, No. 2, p. 1.

As all school districts in Kansas are unified, there appears to be no advantage for weighting the pupil units as is presently done in California where separate elementary and secondary districts exist. The measurement of the unweighted pupil unit is supported by McClune when he makes the following recommendations for states with both elementary and secondary grades in the same districts: "Without the basis of separate elementary and secondary districts, the complexity of weighting in grant formulas need not be introduced."¹¹

Local Ability

Local ability to support education is determined by taxable income per pupil in each unified school district. This method is highly recommended by Peterson,¹² Benson,¹³ and Sharp.¹⁴ The variable in the formula is expressed as a ratio of the taxable income per pupil within the school district to that of the taxable income per pupil within the state of Kansas. When this variable is applied, the districts with both low assessed valuation and personal income will receive the largest percentage of state aid. If a district is wealthy by either assessed valuation or personal income and poor in the other, the two elements will offset

¹¹NEA Committee on Educational Finance, Trends in Financing Public Education (Washington, D.C., 1965), p. 63

¹²Peterson, p. 52.

¹³Benson, Economics of Public Education, p. 101.

¹⁴Sharp and Sliger, p. 328.

each other and a state of equilibrium will be established for the taxpayers.

Local Effort

Local effort is measured by the assessed valuation per pupil. Each district, in order to attain the full maximum budget power, will be required to make a minimum levy of ten mills. With personal income as the measure of ability to pay, the wealthy districts will receive smaller allocation per pupil than poor districts. They have, however, the opportunity to increase their budgets by levying a larger property tax or local earnings tax. The foundation program, therefore, offers true equalization with the implementation of the three elements: educational need, local ability, and local effort.

Supplementary Variables

Supplementary variables for the formula consist of school enrollment, criteria of quality, and pupil-teacher ratio. Statistics from the State Department of Education in Topeka reveal that the larger schools can offer the same program as the small schools at a lower per pupil rate. The following index for school size and costs has been developed from data furnished by the Kansas Association of School Boards and State Department of Education. The scale commences with the median school size assigned to the index number 1 and other enrollments are assigned a ratio based upon actual statistical costs in 1969-70.

Size of School Index Factor

Over	2000	.85
1001 -	2000	.88
901 -	1000	.91
801 -	900	.94
701 -	800	.97
651 -	700 (median size school)	1.00
601 -	650	1.03
400 -	600	1.06
Below	400	1.09

The criteria of quality element, despite some criticisms is one of the variables used in the present Kansas foundation plan. In order to extend the practice of selecting teachers with professional training and experience, this element will continue to be a factor in the new formula. It will be structured, however, as one of four elements creating a multiplier effect. The criteria of quality index is described in Chapter III. State Department statistics reveal that most criteria of quality indexes in Kansas schools are between six and seven. As the maximum index is 10, the variable in the formula will appear as the district's present COQ index divided by 10. The COQ element, as implemented in the new formula, will have some effect upon the distribution but it will not serve the major role as a unit of measurement, as it does in the present foundation program.

Computer systems at the State Department of Education and Kansas Association of School Boards, supplemented by new reporting techniques, will eliminate much of the administrative detail that has been necessary for computing and reporting the criteria of quality.

The pupil-teacher ratio is inserted in the formula as it exists in the present foundation formula. The PTR will be an element for both county and state foundation distributions. The purpose is to encourage boards of education to operate with an optimum number of teachers. The PTR factor cannot exceed one, but with an excess number of teachers it will be less than one. With the multiplier effect, boards employing a larger staff than that authorized in the guidelines will be penalized. If boards employ a staff below the established standards, then that district will receive less than its maximum county foundation allocation. The PTR guidelines are described in Chapter III.

The Proposed Formula

$$G = .326 \times \left[1 + (SC) \left(\frac{TXS}{TXD} \right) \left(\frac{CQ}{10} \right) \left(\frac{PTR}{C} \right) \right] - .010AVP$$

- G = State share of guarantee per pupil
- SC = Size of school element
- TXD = Taxable income per pupil in the school district
- TXS = Taxable income per pupil in the state of Kansas
(\$3608 in 1969-70)
- CQ = Criteria of Quality
- PTR = Pupil-teacher ratio of the district
- C = Required constant for per pupil teacher ratio
depending upon the size of the school
- AVP = Average assessed valuation per pupil

The established guarantee for the foundation program is \$652 per pupil. In order to reach the goal of 50 percent state support, the element G is determined by taking one-half of \$652. The other variables may change due to certain activities within the school district. The SC index could be altered if the school enrollment increases or decreases significantly. A crop failure in one area could cause a significant change in

the taxable income per pupil element. The criteria of quality of teachers for professional hours and experience will change somewhat if a large turnover takes place within a district. The pupil-teacher ratio will change if the district employs too many teachers.

Effect of Federal Funds on District Allocation

Some foundation programs include a provision for federal funds to be deducted from the state allocation. This is no longer constitutional. In the case of *Hergenreter versus Hayden*, the Federal District Court rules it unconstitutional to deduct from state aid any portion of the federal allocation for impacted area students.¹⁵ The philosophy of Public Law 874 expresses the intent on the part of the federal government to relieve local districts of providing total expenditures toward educating the children of the impacted federal employees.¹⁶ Because of the District Court's decision, there can be no provision to include federal funds as a portion of the guarantee per pupil in the foundation program.

Provisions for the Implementation of the Foundation Program

(1) The variable controlled by the State Department of Education is represented by the element 326 in the formula. This element will fluctuate with the average cost per pupil in the United States. It may also change if there is a

¹⁵*Hergenreter vs. Hayden*, F. Supp. Vol. 295, Kansas 1968, p. 25.

¹⁶Johns and Morphet, Economics of Education, p. 427.

fluctuation of Kansas' per capita income in relation to the national per capita income.

(2) In the initial year of the new distribution formula, there are some school districts that would receive less state aid than the previous year. No district, however, will receive less state aid than that received for the 1969-70 school year.

(3) Federal funds are exempt from the distribution formula in making allocations to each district.

(4) The special levies for capital outlay and vocational education will be implemented into the general fund levy. The remaining levies other than the general fund include incentive grant, bonded indebtedness, and social security.

(5) All districts with a total enrollment K-12 of less than 150 will not be eligible to receive state aid or incentive aids or categorical aids. Table XVIII lists the seven districts, their state allocations, enrollments, cost per pupil and mill levies.

(6) Upon implementation of the new program, all boards will be limited to a property tax levy of ten mills for the general operating fund and five mills for approved local incentive effort. All levies exceeding this amount must be approved by the majority of voters. Exceptions to this case will be:

a. All districts will be permitted a total increase in their budget by five percent of the preceding year's budget in compliance with the present statute. The property

tax increase will be matched by state funds determined by incentive formula for the initial year only (HB-1825).

b. If in future years, a district has a decrease in its state allocation, then the district will be permitted to increase the property tax in order to match the preceding year's regular budget with the incentive formula. Additional budget increases must be approved by the vote of the people.

(7) The unit to measure the educational need is the average daily membership.

(8) Enrollments for each school year will be projected by the local board and approved by the State Board of Education based upon the past year's average daily membership.

(9) The provision to appeal for increased budgetary power, will continue as provided in the present foundation program. The rationale for making appeal would be the occurrence of unusual activities within the school district that create an unexpected increase or decrease in enrollment. The State Board of Education will use discretion in considering such appeals. As the school finance plan functions on a year-to-year basis, the State Board may consider past activities and allocations of each district before arriving at a decision.

County Foundation Program

The present county foundation program, as described in Chapter III, will continue with a change in the method of allocating funds. The present program is funded by a county-wide ten mill levy. The change in the method of distribution

will be made by allocating all funds in respect to teacher units with the present PTR guidelines. The ten mill levy will be supplemented by the county distribution fund which is created by local fines and penalties. In order that the allocations are made efficiently, each district's teacher unit grant will be based upon the maximum number of teachers that could be employed for a minimum pupil-teacher ratio. If a district employs less teachers than permitted, then that district will receive a smaller grant than it would be entitled to if it had employed the maximum number permitted. (Example) If District A is eligible for fifty teacher unit grants at \$1,200 per unit for a total of \$60,000 but employed only forty-five teachers, it would receive \$54,000. In reality the total local contribution may total 20 or 25 mills, depending upon the choice of local incentive effort.

The Incentive Program

The second phase of the finance plan is designed to provide state support beyond the foundation program. This phase is necessary to insure a completely satisfactory educational program for every student in the state. The first phase provides funds to support a satisfactory basic educational program relative to national average. If, however, any district desires to improve its programs and is willing to make a local contribution, the state will provide percentage matching funds.

Local Requirement for
Incentive Grants

The major objective of the incentive program is to encourage all districts to extend their services beyond what the foundation program allocates by matching local effort with state funds on terms favorable to districts with a small amount of local ability. The local funds considered in this part of the program are limited to five mills. Should a school district choose to exceed the regular (ten mill general levy and five mill incentive effort) toward further educational programs, it will require a majority vote of the people within the district. The levy for the incentive program must receive an approval from the State Board of Education.

Incentive Formula

The local school funds are matched in the incentive program by a percentage equalizing formula. It is very similar to the formula used in the New York program and is recommended by Larry Burdick in his proposal for Oklahoma. The state support ratio is calculated from the following formula:

$$\text{State Support Ratio} = 1 - \left[\frac{\text{Equalized Assessed Valuation Per ADM in the District}}{\text{Average Equalized Assessed Valuation Per ADM in the State}} \times .50 \right]$$

The state support ratio can be applied to any amount up to a limit of five mills for each school district. It is

based on the principle of fifty percent matching funds at the state level with the exception of wealthy districts. The incentive program is designed to raise revenue with a combined local and state effort equivalent to a state wide levy of ten mills which would be allocated to each district by pupil units. Each district that exerts a maximum local effort of five mills will receive total incentive aid that is determined by the product of the district's average daily membership, assessed valuation per pupil statewide, (\$11,394) and .010 (ten mills state wide).

As local funds are matched by the state with a percentage equalizing formula, a school district with the same assessed valuation per pupil as the state, would receive equally matched funds. Other examples are illustrated. If District A has an assessed valuation of \$5,697 per pupil, the state support ratio would be computed as follows:

$$\begin{aligned}
 \text{State Support Ratio} &= 1 - \left[\frac{5,697}{11,394} \right] \times .50 \\
 &\quad \text{(Local support)} \\
 &= 1 - \left[\frac{1}{2} \times .50 \right] \\
 &= 1 - \left[.25 \right] \quad = .75 \\
 &\quad \text{(Local Support)}
 \end{aligned}$$

The local support from five mills represents the local incentive aid which is 25 percent of the total incentive aid. The state incentive aid as calculated is 75 percent of the total incentive aid, or three times the local effort from a five mill levy in School District A.

If School District B has an assessed valuation of \$17,091 per pupil, its state support is computed as follows:

$$\begin{aligned}
 \text{State Support Ratio} &= 1 - \frac{[17,091]}{[11,394 \times .50]} \\
 &\quad \text{(Local Support)} \\
 &= 1 - [3/2 \times .50] \\
 &= 1 - [.75] \qquad \qquad \qquad = .25 \\
 &\quad \text{(Local Support)}
 \end{aligned}$$

Local support for District B is 75 percent of the total incentive aid and the state support is 25 percent of the total incentive aid. If District B levies a maximum five mills, the state will supplement this amount equal to one third of the local effort.

If District C has an assessed valuation of \$22,786 or more per pupil, it cannot qualify for state matching funds, but may, however, levy the five mills for local incentive aid with the approval of the State Board of Education.

Qualifications for Incentive Grants

To qualify for the incentive program, a district must levy a tax not to exceed five mills above the mandated ten mills for general operation and offer programs required by the State Department of Education or new programs requiring approval by the State Department of Education. Incentive grants can be approved for implementation of special education programs, vocational education (separate from categorical), summer school, enrichment programs, improved salary schedules under guidelines of the State Department, and capital outlay. Capital outlay projects will be approved on a yearly basis only. This includes supplementary building

additions, equipment, maintenance, repair of buildings, purchase of grounds, and capital improvement of grounds. Districts cannot, however, use this particular form of capital outlay for total building programs. New building construction requiring more than one year's financing will remain in its present status and will be approved by the voters of the district. The capital outlay limitation at present is a four mill levy and the vocational education levy limitation is two mills. A four mill levy, however, accomplishes far more for each pupil in a rich district than it does in a poor district. The incentive aid offers the poor district greater ability to raise more funds for capital outlay expenditures than previously under a four mill levy. The same case applies for vocational education. No special levy presently exists for the remaining incentive programs.

Reduction in Regular State Aid

Another qualification for the incentive grant will be a reduction in state aid from the preceding year. If a school district would receive less state aid than the previous year, then its budget can increase only with an increased property tax levy or earnings tax when approved by the people. The incentive grant, however, makes it possible for the district to adopt a budget without going to the people for increased local revenue. For the initial year of the formula, districts may increase their budget up to 105% of the preceding budget and receive percentage matching grants for this amount.

Federal Funds and the Incentive Program

One controversial problem anticipated relative to the incentive aid program is the supplementary federal aid for federally impacted areas. The argument to be presented by non-impacted areas will be the extra aid and budgetary capacity given to impacted areas which would violate the equalization principle. There are two factors to consider. First, a local district must levy ten mills to be eligible for local and state incentive aid. It would appear that districts receiving an abundance of state aid by the regular formula supplemented by allocations from P.L. 874, would find it difficult to warrant a school levy for operational purposes above ten mills. Second, all incentive aid applications are to be approved by the State Board of Education. Each district's financial structure and ability will be considered before incentive grants are approved.

Categorical Aids

The third phase of the proposal is categorical aid. Except for some additions, there will be no major change in the present system of allocating categorical aid grants. Categorical aid will be allocated for the areas of vocational education and driver education. The driver education program will continue as it presently functions but categorical aid in vocational education will be limited to tuition for students attending an out-of-district vocational technical school.

An additional categorical aid implemented in the plan is textbook rental. Kansas statutes state that the citizens of Kansas are entitled to a free education.¹⁷ The plan calls for a flat grant for each pupil in the state of Kansas. This will be weighted by allocating a larger grant for each secondary student than for each elementary pupil. The established rate will be set by the State Department of Education. Textbook rental grants will not apply to activity fees. A survey with a number of school districts in Kansas shows a median of eight dollars for textbook rental in elementary schools and twelve dollars for secondary schools. The average textbook cost per pupil in Kansas is approximately ten dollars. This will require about five million dollars to fund.

Transportation

The formula presently in operation for transportation is basically sound. The allowance per pupil to be transported is adequate and the only problem has been the failure

¹⁷Kansas State Department of Education, 1968 School Laws of Kansas, KSA-4154, p. 454.

of the legislature to fully fund the transportation allocations. In the 1969-70 school year the State Department received 91.7% of the intended allocations for the public schools. The new finance plan recommends 100% funding of the present program. It is not, however, included in the three phases of the proposal.

Cost of the Program

Displayed in Table XIV, second column, are the expenditures for the 1969-70 school year. Column 3 is the required expenditures for the new proposed school finance plan. The new plan shows the implementation of the capital outlay and vocational programs with the incentive program.

TABLE XIV
COST OF PRESENT AND PROPOSED FINANCE PLANS

Expenditures	1969-70	Proposed Expenditures
Ad Valorem Taxes	\$161,150,672	\$ 49,787,085
County Foundation	52,599,350	54,279,193
State Foundation*	127,039,500	221,070,259
County Distribution		3,000,000
Capital Outlay	14,749,820	
Vocational	5,474,440	
Incentive--State		31,854,746
Incentive--Local		26,765,400
Categorical		10,000,000
Transportation	5,960,500	6,500,000
Penalized Schools		196,277
		5,964,886 Sup. local efrt.
		5,789,781 Sup. state efrt.
Totals	\$366,974,282	\$415,207,627

*Includes categorical

Source for Present Plan: Statistics Department, Kansas State Department of Education

The proposed transportation costs represent 100% funding of the present formula.

In Column 2, the state foundation allocation of \$127,039,500 represents the original foundation program plus the supplement of \$26 million implemented in 1969, the special aid for distressed districts, and all categorical aid. In Column 3 the county foundation fund will be supplemented for an estimated \$3 million in the county distribution for a total of \$57,279,193. The county levy will be slightly less than ten mills which will raise \$54,279,193. The county distribution is a collection of fines, penalties, and sales residue at the county level. The new foundation program will cost \$221,070,259. There are 14 districts that will actually have less state aid than they received in 1969-70. This amount totals \$196,277 and reveals some of the inequities of the present distribution program. The new finance plan, however, does propose that the \$196,277 be continued to be distributed to the schools in order that no district will receive less state aid than it received previously. This gesture will help win adequate support for implementation of the program and will not penalize other districts significantly.

The categorical aid requirement is estimated at \$10 million. Approximately one-half of this amount will be earmarked for textbook rental, and the balance will be allocated for special programs in vocational education and driver

education projects. The new plan shows an increase in expenditures of \$48,233,395.

The most significant impact of the proposed finance plan is the shifting of taxes to other sources from the property tax. Statistics reveal that the new foundation plan will cause a decrease in property tax of \$97,177,720. These figures, however, do consider maximum local effort so it is highly probable that the property tax decrease will exceed \$100 million. It will be necessary, however, to raise \$142,411,063 from new sources to finance the total program.

The incentive aid program will cost the local taxpayers \$26,765,400 if all districts participate with the maximum levy of five mills. The state portion will be \$31,874,746. An additional \$5,964,885 will be required through local effort and \$5,789,787 through state effort for some districts to exceed their previous budget by 105 percent. This applies to 42 school districts whose state allocation supplemented by the local ten mill levy and incentive aid would still limit their budget to an amount less than the previous year. The incentive formula will be used by these districts to exceed the present budget up to 105% for the initial year only. The remaining districts will be limited to a maximum of ten or fifteen mills depending upon their choice of incentive aid. The 42 districts, however, will have a higher property tax or by choice may impose a non-property tax with voter

approval in order to offer their children the same educational opportunity as do other districts.

Revenue for the Finance Plan

The finance plan will require \$142,441,063 in new funds to support the program. Increase in expenditures will total \$48,233,395 from the 1969-70 school year to the 1971-72 year.

Any defensible foundation proposal must be supported by a program for raising revenue to fund it. Peterson,¹⁸ Benson,¹⁹ and Sharp²⁰ cite the state income tax as the one resource not yet reaching its full potential use.

Three alternatives are listed in preferential order for funding the foundation program:

(1) A 100% surtax on personal income tax in Kansas. This represents a potential of about \$100 million in new revenue.

(2) A combination of several of the following tax reforms will assist in providing the necessary revenue for the finance plan:

a. The elimination of federal tax deductions on state income tax will raise \$25 to \$30 million. This is progressive step and it places the incidence upon high income.

¹⁸Peterson, p. 51.

¹⁹Benson, p. 106.

²⁰Sharp, p. 327.

b. The ton mile tax on motor carriers would create a tax earmarked for highway programs which in turn could free state funds for transferral to education or other state needs.

c. The oil and gas industry also offers potential tax resources. This industry likewise has enjoyed a free ride in Kansas. A severance tax will enhance the possibility of funding necessary revenue for the educational foundation program.

d. A 55% across the board increase in all income and corporate tax will raise \$60 million.

(3) A $\frac{1}{2}$ % increase in sales tax would provide \$25 million in revenue. This tax is regressive in nature, though geared to be proportional. It is a hidden tax that by all indications meets with less resistance than the more progressive taxes.

(4) Federal tax sharing--In long range planning, it is possible that the federal government will consider tax sharing with the states to support education and other government agencies. Several proposals have been submitted to Congress. Forest Conner, Executive Secretary of the American Association of School Administrators recommends a tax sharing plan to the states from federal funds prorated on a density-sparsity correction and wealth ratio.²¹ A similar proposal

²¹Forest Conner, "Federal Policy and the Public Schools," American Association of School Administrators (Washington, D. C., 1966), pp. 22-25.

by the National Education Association would allocate six billion dollars to the states. Kansas, being an average state, would receive about \$100 per student. This would provide \$50 million of new revenue.

Summary

When the comprehensive study of the necessary elements for a distribution program is completed, the most important task to perform is the arrangement of the elements for an appropriate foundation program.

The school finance plan will consist of three major objectives:

- (1) increased state support
- (2) change in the distribution formula
- (3) shifting of tax structure from property tax to sources that are equitable, efficient and adequate.

In order to build a framework for the foundation program, the objectives are supplemented by sub-objectives. The sub-objectives include: a minimum of fifty percent state aid for all schools except for the wealthy districts, a system of rewarding school districts for extra local effort and employment of highly professionally trained faculties, an option for the citizens to support education by non-property in place of property taxes, protection for the property taxpayer in the form of a tax lid, an option for citizens to exceed the tax lid by majority vote, a provision for wealthy districts to exceed the tax lid if allocations are limited

because of wealth factors in the formula, provisions for allocations from state, county and local level, a provision for local control to set standards of operation with national average expenditures or below or above national standards, provisions for incentive and categorical aid, provisions for variation in wealth, school enrollment and pupil-teacher ratio, and provisions to finance the program with a "good tax."

The finance plan is divided into three phases. The first phase is the foundation program at both state and county levels. The second phase is the incentive program and the third phase is categorical aid. The foundation program provides at least fifty percent state aid for all school districts except for those classified as wealthy districts.

The relationships between state per capita income to the national average and state expenditures for education with the national average cost per pupil serve as the criteria for establishing guaranteed costs for each school district in Kansas. As the national average for school expenditures is \$673 and the per capita income for Kansas is 97% of the national average, the foundation plan will support a guaranteed cost per pupil of \$652.

The framework for the foundation program consists of three major elements: educational need, local ability, and local effort. The measurement of educational need is defined as the pupil unit. Local ability is determined by

taxable income, per average daily membership. Local effort is measured by the assessed valuation per pupil. Supplementary variables for the formula consist of school enrollment, criteria of quality and pupil-teacher ratio.

Provisions for the foundation formula include: exemption of aid by districts with K-12 enrollment less than 150, permission for districts with smaller budgets than previous year to increase new budget to 105% of previous year, tax lid of ten mills for general operating levy except for wealthy districts and guidelines to appealing for budget increases. The county foundation will be distributed in teacher units. The allocation per teacher will be determined by the pupil-teacher ratio. Revenue for the county foundation is funded through a county-wide ten mill levy.

The second phase of the finance plan is the incentive aid program. It is designed to provide state support beyond the foundation program. The major objective of this program is to encourage districts to extend their services by matching local effort with state funds determined by a percentage equalizing formula. Wealthy districts will not receive state incentive grants but may impose a local levy for incentive purposes. To qualify for the incentive program a district must impose a levy not to exceed five mills above the mandated ten mill levy. Incentive grants will be approved for special education, enrichment programs, improved

salary schedules, and capital outlay. School districts may also qualify for incentive aid if their allocation from the foundation program decreases from the previous year. A controversy may possibly exist if some schools qualify for both incentive aid and federal impacted aid. A recent United States District Court decision makes it unconstitutional to deduct any portion of P.L. 874 funds from state appropriations. Incentive grants, however, must be approved by the State Department of Education.

The third phase of the proposal consists of categorical aid. It will exist in the form of flat grants for vocational education, driver education and textbook rental. There is no change in the transportation aid except to provide one hundred percent funding for the present program. No district will receive less aid than the previous year. If all districts participate at maximum effort, the local incentive aid will total \$26,765,400 while the state incentive aid amounts to \$31,854,746. With maximum incentive aid, there will be forty-two districts whose budgets are less than the 1969-70 budget. Operationalizing the incentive aid formula in order that all districts may increase their budgets to a 105% limitation will require \$5,964,885 of supplementary local effort and \$5,789,781 of supplementary state incentive aid.

Categorical aid will cost approximately \$10 million, of which one-half will be earmarked for textbook rental.

The total school finance plan shows an increase in expenditures of \$48,233,345. It will be necessary, however, to raise \$142,411,063 in new revenue. The significant change is the reduction in property tax by almost \$100 million. Alternatives for raising the revenue necessary for the foundation plan include: (1) 100% surtax which will raise about \$100 million, (2) a combination of tax reforms such as elimination of federal income tax as an exemption from state income tax, ton mile tax on motor carriers, oil and gas severance tax, and 55% across the board on all personal and corporate income tax, (3) $\frac{1}{2}$ % increase in sales tax, and (4) federal income tax shares to states would raise \$50 million for Kansas. This is important for long-range planning.

CHAPTER V

APPLICATION OF THE FINANCE PLAN

The application of the distribution program is designed to determine the effects on districts that differ in size, wealth, effort and total requirements of the state. The application as presented in Tables XV and XVI indicates the procedures for the calculation of the amount of state support and the results of the calculations.

The explanation of data and presentation for each of the three phases of the plan is preceded by a review of specific facts relative to the foundation program that has been developed through established principles and criteria of standards. The discussion of Tables XV and XVI is designed to provide the necessary information which will insure an understanding of the operation of the program. The presentation concludes with a description of the necessary procedures for implementing the finance plan.

Facts About the Plan

(1) The finance plan requires a total increase in expenditures of \$48,233,395 over the 1969-70 school year.

(2) The plan shows a minimum decrease in property tax of \$97,177,720.

- indicates increase in mill levy from 1969-70.

(3) Additional revenue at the state level necessary to make the program operational will require \$142,441,063 from new sources.

(4) Transportation is not a part of the finance plan but will continue independently with the present funding procedure.

(5) Incentive grants may be approved by the State Board of Education for the following reasons: special education, vocational education, summer school, enrichment programs, improvement of salary schedules, capital outlay, and decrease in state aid from the preceding year. Capital outlay projects will be approved on a yearly basis only. This includes building additions, equipment, maintenance, repair of buildings, and purchase of lands.

(6) \$10,034,068 is provided for categorical aid. This is not reflected in Tables XV and XVI. Vocational education, textbook rental, and driver education qualify for categorical aid.

(7) General operation levies for school districts will be placed under a tax lid of ten mills. An additional five mills may be levied for incentive aid if the project is approved by the State Board of Education. All districts with a budget less than their 1969-70 budget may exceed the 15 mills and receive additional incentive aid in order to increase the budget capacity to 105% of the 1969-70 budget. For expenditures above the set limitations, approval must come from the majority of the voters. The patrons of each

district may have the option to vote for non-property taxes in lieu of the property tax.

The Foundation Program

Table XV shows the results of the foundation formula when applied to all unified districts of Kansas. Column 1 lists the enrollment as of September 15 during the 1969-70 school year. Column 2 gives the taxable income per pupil in each unified district. Column 3 shows the wealth of each district in terms of assessed valuation per pupil. Column 4 gives the amount of state aid each district received. Column 5 reflects the percentage of the 1969-70 budgets as funded by state aid. Column 6 reveals the allocation for each district by the distribution formula. Column 7 gives the percentage of the proposed budget being allocated by state aid. Column 8 lists the 1969-70 operating budget. Column 9 gives the proposed budget for each district resulting from the ten mill local levy, the ten mill county foundation levy, and allocation from the foundation program. Column 10 lists the general operating levy in terms of mills for the 1969-70 school year. Column 11 gives the mill levy reduction for each district as a result of the foundation program.

An application of the foundation program will provide \$221,200,539 in state aid, which constitutes 67.3% of all budgets. Budget capacity will total \$328,266,817 without incentive or categorical aid. This provides a guarantee of \$656 per pupil. State aid totaled \$119,176,041 in 1969-70

representing 35% of all budgets. Fourteen districts will receive less state aid than that received in 1969-70. Table XVII lists the districts relating their present mill levy and the amount of the decrease. The total decrease amounts to \$196,277.

Incentive Program

Table XVI shows the application of the foundation program supplemented by the incentive aid formula. Column 1 in Table XVI lists the local incentive aid contribution. Column 2 shows the amount of the supplementary state incentive aid. The total sources of incentive are combined in Column 3. Column 4 shows 100% funding of the present transportation program. Column 5 reveals the computation of the possible budget for each unified district. The sum of vocational and capital outlay levies are listed for each district in Column 6. Column 7 is the computation of maximum budgets. This represents 105% of the combined vocational and capital outlay and general operating funds of 1969-70. It applies only to the 42 districts who have a smaller proposed budget than that of 1969-70. Column 8 lists the mill levy for each district if each participates with maximum local effort. Column 9 shows the increase of total expenditures over the 1969-70 budgets for each district. Column 10 reveals the increase or decrease in the levy. The final adjustment in the general levy considers maximum local effort.

TABLE XVII
SCHOOL DISTRICTS TO RECEIVE LESS STATE AID

School	Enrollment	Decrease in State Aid	Adjusted Assessed Valuation Per Pupil	Present Mill Levy
Hugoton	997	\$ 34,000	\$ 44,119	5.99

Total	5,239	\$ 196,277		

Source: Statistics Department, Kansas State
Department of Education

Table XVI shows the effects of the incentive program on each district when it supplements the foundation program.

If the maximum effort of five mills is applied by all districts, the local incentive effort will total \$26,765,430. Supplementary incentive aid from the state in the form of percentage matching grants will amount to \$31,854,746. In order for the 42 districts to increase their budget to 105% of their 1969-70 budgets, it will require \$5,964,886 of supplementary local effort to be matched by \$5,789,781 in supplementary state incentive aid. These 42 districts are identified by an asterisk in Table XV.

Categorical Aid

The estimated cost of \$10,000,000 for categorical aid is not reflected in the total possible budget in Column 10 of Table XVI. As most of this phase of the plan is allocated in flat grants and earmarked for special purposes, there will be no significant impact on budget power and levies. Approximately one-half of the grants will be allocated for textbook rental and a large portion will be designated for tuition to vocational schools. Flat grants for the purpose of driver education will continue to be allocated as they are in the present program. Districts will not receive incentive and categorical aid for the same project. The total expenditures from categorical aid is based on present grants plus textbook rental provided that all districts give maximum participation in categorical and incentive aid programs.

If all districts give maximum participation in categorical and incentive aid programs, then the state will provide 64.7% of the total expenditures. The average expenditure per pupil will be \$830. The finance plan will provide \$415,207,627 in expenditures, compared to \$366,974,282 in 1969-70.

The increase in expenditures of \$48,233,395 over a two-year period represents a 6.5% average increase compared to a 9% increase in expenditures at the national level for one year.

Procedure for Implementing the Program

Upon completion of a project with the magnitude, such as this finance plan, it is necessary to recognize that the most difficult task is yet to be accomplished in fulfillment of all objectives.

The ultimate goal is for the plan to be adopted by the Kansas State Legislature. There are, however, significant steps that will need to be taken before the matter is brought to the attention of the Legislature. The following procedure indicates the proper order for the implementation of the finance plan.

- (1) Recognition of obstacles:
 - a. Apathy
 - b. Understanding of definitions
 - c. Acceptance of change
 - d. Political process
- (2) Development of principles and criteria for standards

- (3) Accumulation of data
- (4) Use of decision models
- (5) Development of hypothetical model
- (6) Operationalization of model
- (7) Evaluation of results
- (8) Documentation
- (9) Presentation
- (10) Endorsement by power groups
- (11) Endorsement by news media
- (12) Presentation to legislative and gubernatorial candidates
- (13) Presentation to Joint Legislative Committee of Educational Finance
- (14) Solicitation of support in lobby by power groups
- (15) Adoption by committee
- (16) Adoption by Senate and House
- (17) Signature of Governor

Summary

An application of the distribution program reveals what effects school size, wealth and effort have on each school district in Kansas. The application requires a number of items of information. The list of items for each district includes enrollment, assessed valuation per pupil, taxable income per pupil, 1969-70 budget, percentage state aid, transportation allocation, mill levies, expenditure for capital outlay and vocational education, criteria of quality and pupil-teacher ratio.

The application further reveals the new budget and new mill levy in comparison to 1969-70 data. Computation is made on the basis of maximum participation for local effort. The total proposed budgets permit each district to increase their 1969-70 budget by at least five percent. This restraint, however, applies only to 42 wealthy districts whose possible budget is less than the 1969-70 budgets. It is necessary for these districts to exceed the fifteen mill limitation in order to increase their budget.

Additional increases must be approved by the voters of the district. The remaining districts will have increased budgets greater than five percent and will maintain a levy of fifteen or less mills.

An application of the foundation program will provide 67.3% state support and guarantee expenditures of \$656 per pupil. An application of the incentive program and categorical aids with the foundation program provides a total guaranteed expenditure of \$830 per pupil and 64.7% state support. Application of the finance plan will require a \$48,233,295 increase of the 1969-70 budgets, which represents a 6.5% per year increase compared to a national average of 9% during the past two years. The most significant element of the plan is the \$97,000,000 property tax relief, which supplemented by new costs will require \$142,441,063 from new sources.

At least one-half of the \$10 million in categorical aid will be ear-marked for textbook rental. The balance will be distributed for vocational education, and also for

driver education. The procedure for implementing a school finance plan consists of a series of seventeen important steps in order form. The most difficult and important step is the adoption of the plan by the Legislature.

CHAPTER VI

EVALUATION OF THE FINANCE PLAN AND RECOMMENDATIONS

The fact that a considerable amount of money is spent on public education is important, but the crucial question in public education is the worth of the educational product that will be purchased with these dollars.

The evaluation of the finance plan is based on the twelve principles that were presented in the first chapter as guides to the solution of the problems related to the fiscal needs, abilities, and effort of the public schools. These principles provide an excellent basis for the examination of the effectiveness of a total financial program supported from local and state sources but exclusive of federal aid.

The evaluation is supplemented by Tables XVIII through XXII which give a comprehensive report on goal accomplishments of the proposed finance plan.

Evaluation

All of the principles are utilized in the evaluation even though some of them do not directly apply to the foundation program since it is limited to the distribution of state and county funds.

Source: Statistics, Kansas State Department of Education

The first principle indicates that the financial support of public education should be shared by all citizens at all levels of government. The finance plan provides the essential support of education from both local and state sources. The amount of state support is not only significantly increased but is distributed on an equalization basis. The county-wide property tax plus the ten mill local levy introduces equalization at the local levy. This equalization of financial support must be present if citizens throughout the state are to be able to provide equal educational opportunity with the same amount of effort. As federal aid is not included in the finance plan, this principle is only partially satisfied.

The second principle recommends greater responsibility on the part of the state for support of public education. It specifically cites a minimum of fifty percent state support for the operation of a fiscal school year with exceptions in the wealthy districts. Table XXI shows that 237 of the 310 districts would receive fifty percent or more of the guaranteed expenditures from state sources.

The third principle involves a concept that the local school district's ability to pay should be measured in terms relative to both the adjusted assessed valuation per pupil and taxable income per pupil within each district. The implementation of the taxable income element supplemented by the Strayer-Haig concept, which requires a ten mill local

effort on the part of each district for maximum budget power, satisfies this principle.

The fourth principle emphasizes the objective of continued local controls for boards of education in order to maintain a high interest level required for quality education. A strong point for the pupil unit and the incentive program is that it leaves the boards of education free to make decisions concerning the operation of school systems that they serve. Although the plan is based on a mandated ten mill local levy, local boards still retain the power to levy less than this amount or they may levy up to fifteen mills if they participate in the incentive program. Boards may also ask for increased expenditures beyond the fifteen mill levy, with approval by the voters. Therefore, each phase of the finance plan satisfies this principle.

The fifth principle states that the amount of state support for public schools should be based on a per capita income within the state of Kansas in relation to the national per capita income. The economic limitations of the plan are based upon this principle. The distribution of the foundation program guarantees an expenditure of \$656 per pupil whereas the principle recommends at least \$652 by utilizing the present variables. An outstanding feature of the formula is that when the national average expenditure per pupil increases, the variables will increase allocations for Kansas schools and serve as an automatic stabilizer for inflation or recession.

The sixth principle recommends an inverse relationship between the amount of state aid received in each school district and its assessed valuation per pupil relative to the state average assessed valuation per pupil. The incentive program is based entirely upon this principle. A review of data in Tables XX and XXII will reveal that this principle has been satisfied.

The seventh principle recommends the implementation of specific elements in the distribution formula. The distribution formula is composed of the elements recommended in this principle.

The eighth principle recommends the exclusion of transportation costs from the distribution formula. Transportation costs are listed in Table XVI for information purposes, but are actually not part of the distribution formula.

The ninth principle recommends that budget capacity be preplanned in respect to projected enrollment. As the unit of educational need is average daily membership, it will be necessary to project enrollment in order to make long range budgetary plans. This principle has been satisfied.

The tenth principle stresses a need for school aid being supported by a good tax. The principles of a good tax are established as equity, efficiency, and adequacy. The choice of state income tax serves as the best alternative to satisfy this criteria.

In order to be equitable, the tax must be progressive and place the incidence where the wealth is. Duplication of

federal income tax forms and state deductions makes the state income tax efficient. Research shows the state income tax as the best potential untapped or unused source of revenue. It is possible, however, that it will require some less progressive tax to make the entire revenue feasible. This principle has been moderately satisfied.

The eleventh principle recommends funding for capital outlay and school textbooks. Capital outlay is included as one of the approved programs for incentive grants. It is, however, restricted to a one year program. Categorical aid provides flat grants for textbook rental on a per pupil basis. This principle is not completely satisfied.

The twelfth principle places a restraint on school districts for state aid if their school enrollment (K-12) is less than 150 students. Seven districts with a school population less than 150 now receive state support from the present foundation plan. A recommendation to reorganize these districts with an adjacent unified district will follow. This principle, however, does not have direct application of the finance plan. Table XVIII lists the seven districts with their enrollment, mill levy and cost per pupil.

The above principles for financing public education that are directly applicable to the distribution formula have been adequately satisfied by the procedures suggested in this finance plan.

An examination of Tables XV through XXII reveals very significant changes from the present finance plan to the new finance plan.

The principles in Chapter I established a goal of 15 mills including incentive aid as the local effort toward a guaranteed expenditures. Table XX shows that 223 of the 310 districts can operate with a levy of 15 mills or less and maintain maximum budgetary power. The principles also establish a minimum guarantee of \$652 per pupil with each district, other than the wealthy districts, receiving at least 50% state support. Table XIX gives a comprehensive review of the distributions with the present foundation program, the new foundation program and the new foundation program supplemented by the incentive program. An examination of these data will clarify that the objectives stated in the principles have been satisfied.

Three very important characteristics of a desirable state school finance plan are the simplicity of the plan, the incentive to the local school district, and the equalization of effort among districts.¹ The pupil unit and the percentage equalizing formula provide the necessary simplicity, however, the distribution formula itself is somewhat complex. Computer systems can eliminate the necessity of administrative detail in revenue projection. Incentive to raise more local revenue for education is an integral part of the second phase of the program. Equalization of effort is achieved at the county level with the ten mill levy and at the local level with the mandatory ten mill levy in order to achieve maximum budgetary capacity.

¹Burdick, p. 128.

There are strong indications that public education in Kansas needs to be funded at the level recommended in this finance plan. The plan, if necessary, could operate at a level lower than the 50% minimum state support in all but the wealthy districts, but the quality of education sought by power groups cannot be a realistic goal if a lower level of support is implemented.

Recommendations

The first two groups of recommendations indicate the changes in the Kansas Constitution and statutes that are necessary in order to implement the finance plan. The general recommendations suggest possibilities for further study and additional actions that are necessary for the program to function properly.

Constitution

1. The present Kansas foundation program should be repealed with the exception of the County foundation program which will be retained as part of a new finance plan.

2. The present tax lid on school levies should be repealed in order that the number of mills allowed in the proposed levies may be dictated by the statutes.

Statutes

1. The measure of educational need in the present foundation program should be replaced by a measure based on a pupil unit. The state foundation program would use the

average daily membership multiplied by a state share of a guarantee as the measure of need. The state share is determined by the following distribution formula:

$$G = X \left[1 + (Sc) \left(\frac{TXD}{TXS} \right) \left(\frac{CQ}{10} \right) \left(\frac{PTR}{C} \right) \right] - .010AVP$$

X = 50% of product (per capita income ratio X national average cost per pupil)

G = State share of guarantee per pupil

SC = Size of school element

TXD = Taxable income per pupil in the school district

TXS = Taxable income per pupil in the state of Kansas (\$3,608 in 1969-70)

CQ = Criteria of quality

PTR = Pupil-teacher ratio of the district

C = Required constant for per pupil teacher ratio depending upon the size of the school

AVP = Average assessed valuation per pupil

2. The official school enrollment as recorded on September 15, which is presently used as the legal measure of the number of students should be replaced by average daily membership of the preceding year to determine the educational need, but provision should be made for adjustment for increases or decreases in membership during the current year.

3. Only unified districts (K-12) with an enrollment of 150 or more are eligible to receive state support.

4. The present equalized assessed valuation indicates that the following mill levy should be authorized: ten mills on a county levy for the county foundation program which will be redistributed on a teacher unit basis, ten mills authorized by the board of education of the school district for regular general operating fund, five mills by the board of education for incentive grants to be supplemented by equalized matching grants at the state level, and an unlimited

number of mills that may be authorized by a majority of the electors of the district voting on a proposed levy.

5. A tax levy on intangibles should be discontinued.

6. All assessed valuations of property will be in compliance with thirty percent ratio as now established in Kansas Statutes.

7. State aid allocations per pupil will be made to district for each pupil regardless of his residence. The home district of a student, however, must grant permission for students attending another district, in order for allocations to be made. Students attending a vocational technical institute for one-half day will be counted as one-half students in their home district.

8. The following percentage equalizing formula should be established as a basis for distribution of state funds for the incentive program:

$$\text{State Support Ratio} = 1 - \left[\frac{\text{Equalized Assessed Valuation Per ADM in the District}}{\text{Average Equalized Assessed Valuation Per ADM in the State}} \times .50 \right]$$

9. Categorical aids for vocational education, driver education, and textbook rental will be funded as flat grants. Vocational categorical grants will be allocated for approved applications of secondary students and adults attending a vocational technical school.

10. Exceptions to the tax lid will be made during the initial year only for those districts whose budget

limitations were less than the 1969-70 budget. All districts will be permitted to increase their total budgets to at least 105% of the preceding budget. The increase above the 15 mill limitation will be funded by a local and state partnership determined by the incentive grant formula. Following the year of the implementation of the finance plan, all increased expenditures that require an increase in the local levy must be approved by the voters of the district.

11. The board of education will have the option of placing before the patrons of each school district the choice of property tax or some designated non-property tax for local support of public schools.

12. School levies that may be imposed are general operational, incentive, social security and bonded indebtedness. Local incentive levies require state board of education approval and all bonded indebtedness must be approved by the majority of voters.

General Recommendations

1. The present state support for transportation should continue but be funded at 100% instead of on a prorated basis as in the past.

2. The state income tax should be examined very carefully to determine the possibility of increasing the revenues from this source. A comprehensive study of the sales tax that will provide exemptions for various necessities should be made in order to develop a more progressive tax revenue from this source.

3. A comprehensive study should be made to investigate other possible revenue sources. Some possibilities include business and professional services, gross receipts on public utilities, ton mile tax on motor carriers, oil and gas severance tax, validation of merchants inventory, tax withholding on cash transactions, and elimination of federal income tax payments as a deduction from state income tax.

4. The position of tax assessor should cease being a political office and be changed to an appointed office with civil service status requiring specific qualifications.

5. All school districts should be placed on improved accountability for efficient operation. Appropriate steps to implement PPBES in all districts should be taken as quickly as possible.

6. A comprehensive study for the extended school year should be made in Kansas to seek possible reduction in school expenditures and future needs as well as improving the educational opportunities.

7. The increased use of para-professional employees should be encouraged and a state-wide in-service training program should be established for this service.

8. A new technique of reporting college hours and experience of teachers should be devised in order to eliminate unnecessary details for computing the criteria of quality. Computer systems at both the State Department of Education and Kansas Association of School Boards are available to give all districts their COQ in one operation. This technological

improvement makes it feasible to retain a major element in the present foundation program and eliminate the controversial administration tasks.

9. Long-range planning should include provisions to ultimately reach a minimum goal of sixty percent state support of education in all districts except those defined as wealthy districts in this project.

Conclusion

There should be a concerted effort among all citizens and members of the educational profession, leaders of government and various groups of citizens at large to take stock continuously in the educational purpose and goals for Kansas. Organizations with an interest in education should seek increased resources for research and planning of educational improvement. The citizens of every school district should seek ways to utilize Kansas' great potential of cultural resources for the improvement of schools. There should be continued emphasis placed on school legislation which will encompass well-planned programs of development. Certain power groups feel that the current unrest among members of the educational profession is an indication of a potentially deeper crisis in Kansas' schools if legislators cannot take corrective steps toward the improvement of conditions within the Kansas public schools.

The state needs not only additional financial assistance and more equitable distribution of funds, but it also needs

a rebirth of community interest for educational purposes with vigorous financial support that is essential to the existence of effective schools. The leadership for this task must be assumed by the public school superintendents with assistance from educational organizations and interest groups.

The program developed in this finance plan provides the necessary procedures to insure that the distribution of state funds will successfully equalize educational opportunity and provide incentive for additional local support of education.

Summary

The most crucial question in evaluating public education is determining the worth of the product to be purchased with the appropriated funds.

The evaluation of the finance plan is based on the twelve principles that were presented in the first chapter as a guide and by examination of the tables which offer a comprehensive comparison between the present Kansas program and the proposed finance plan.

The principles that are directly applicable to the distribution formula have been adequately satisfied. An examination of the tables reveals significant changes from the present program to the new finance plan. The established goals for maximum local levies of fifteen mills and minimum of fifty percent state support are accomplished, except in the wealthy districts.

Three desirable characteristics achieved with the finance plan are simplicity, local incentive and equalization of effort. Public education in Kansas definitely needs to be funded at the level recommended in this project. If necessary funds are not available, the formula will work satisfactorily for a lower level.

The first two groups of recommendations indicate the changes in the Kansas Constitution and statutes that are necessary to implement the distribution program. General recommendations that suggest further study include: 100% funding of present transportation program, review of state income tax structure, investigation of other possible revenue sources, establishment of a new accountability system for all school districts, a comprehensive study of the extended school year, increased use of para-professional employees supplemented by in-service training and a new methodology for computing the criteria of quality that offers more simplicity and less detail.

The program outlined in this finance plan provides adequate financial support for public education in Kansas and a desirable method for the distribution of state support. The adoption of the new plan, however, will not be an easy task. A finance plan for the public schools of Kansas will become a reality only when the school administrators of Kansas assume the leadership and create a stronger interest on the part of various power groups. If the individuals within these groups make a concerted effort, it will be

possible to win acceptance from the Legislature and the citizens of Kansas.

Dear

I am at present, a graduate student in residence for work toward the Doctor of Education Degree at Oklahoma State University. I am on leave from my position as superintendent of schools at Haysville, Kansas.

For my dissertation, I have selected the task of writing a new school foundation finance plan for Kansas elementary and secondary schools. It is my utmost desire that this project will make some contribution to the solution of school problems of Kansas. In order to prepare a proposal that will receive favorable consideration, it is necessary to know the objectives and ideals of those who will be influential in reconstituting the present foundation program. I have enclosed a set of principles, in which to serve as standards for criteria of a new plan. The key word or phrase is underlined in each principle. Would you please respond to each principle on the response sheet? If you disagree, please make a suggestion in the comment space. Your contribution will be greatly appreciated.

Sincerely,

Enclosure

Bryce Stallard

SURVEY QUESTIONNAIRE FOR DEVELOPING A
SCHOOL FOUNDATION PROGRAM

PRINCIPLES

1. Financial support of public education should be a joint partnership of the local government, state government, and federal government.

It is imperative that the federal government increase its participation of support for public education but continue its role as a junior partner. Experience with administration of federal education appropriations has shown that a desirable plan would be to allocate funds at the federal level from the United States Office of Education directly to the respective state departments of education and not to the local school districts. There have been many federal programs during the past twenty-five years that have created a wide variety of opinions as to the success derived from their contributions. The most desirable form of federal aid would be direct grants to the states. This plan should be administered with the foundation principle itself in relationship to state wealth.

2. The state of Kansas must assume a greater responsibility of support for public education. All unified school districts should receive a minimum of 50 percent state support for the operation of a fiscal school year. Local boards of education should be free from unreasonable restrictions in the administration of fiscal affairs and from undue controls from state agencies. When school boards are hampered

in the exercise of their judgment to solve a great variety of problems facing them, the education of individuals suffers.

3. The measure of the local school districts' ability to pay should be in terms relative to both the property tax base and the local economic index of personal income. The local tax base should not be expected to bear more than a fair burden of the total load. Consideration must be given to the school districts of high income areas that have a low assessed valuation for tax base and to those school districts with a high assessed valuation as in the case of some rural areas, but personal income is limited when farm land does not produce and income is hampered.

4. Boards of education should continue to be fiscally independent of other governmental bodies and in order to maintain the high interest level required for quality education at the local level, each district's guaranteed share will be established in relation to a local levy of 15 mills. This levy, however, will not be compulsory. As a local incentive they should be permitted to increase the levy an additional ten mills without a vote of the people. For districts that display a desire to improve the quality of education by levying above the 15 mills, there should be an available incentive grant prorated with an inverse relationship to the property tax. The appeal for such funds should be subject to approval by the State Board of Education.

5. The amount of state support given to the public schools should be based on the per capita income within the State of Kansas in relationship to the national per capita income and national average of state support for public schools.

6. There should be an inverse relationship between the amount of state aid received and the school district's assessed valuation per pupil relative to the state mean assessed valuation per pupil.

7. The variables for the distribution formula to be given attention are as follows:

- (1) Ability to pay--property tax
- (2) Local economic index--personal income
- (3) Size of school
- (4) Professional training and experience of teachers
- (5) Pupil-teacher ratio

8. Transportation costs and sparsity factors should be excluded from the foundation formula.

9. Budgetary capacity should be pre-planned in each district with regard to projected enrollment.

10. The proposed plan for school aid should be supported by a good tax. Three principles of a good tax are:

- (1) Equity
- (2) Efficiency
- (3) Adequacy

11. Funding in the school foundation plan should provide expenditures for capital outlay and school textbooks.

12. School districts eligible for state support should have a minimum school enrollment of 400, (K-12), for quality education. All money received in federal grants should serve strictly as a relief to property tax at the local level and have no effect on the state foundation distribution whatsoever.

Results of Survey

<u>Principle Number</u>	<u>Result</u>
1	Response---unanimous. Agreement on principle as written.
2	Response---Should be 50% or more but hopeful for at least 40%.
3	Response---Agreement with principle as written.
4	Response---Equal opinion of 10 mill or 15 mill mandatory levies, contingent upon county levy.
5	No consensus arrived at.
6	General agreement with principle as written if income is also an element.
7	Response---Shows agreement with all variable listed except professional training of teachers.
8	Unanimous agreement with principle as written.
9	Response---Shows agreement with principle but concern over of technique of penalization of schools who over-project enrollment.
10	Response---Shows total agreement but questions the source of a good tax.
11	Response---Does not show total agreement for foundation program to finance capital outlay and textbooks.
12	Response---In that some school districts in Kansas are too small to operate as an independent district. An agreement to a minimum size is not arrived at in this survey.

VITA

Bryce Duane Stallard

Candidate for the Degree of

Doctor of Education

Thesis: A PROPOSED FINANCE PLAN FOR STATE AID TO ELEMENTARY AND SECONDARY SCHOOLS IN KANSAS

Major Field: Educational Administration

Biographical:

Personal Data: Born in Topeka, Kansas, November 17, 1926, the son of Hobart and Lottie Stallard.

Education: Graduated from Lawrence High School, Lawrence, Kansas, in 1944; received the Bachelor of Arts degree from Baker University, with a major in mathematics, in August, 1950; received the Master of Education degree from the University of Kansas, with a major in secondary education in August, 1960. Master's thesis used as a guideline by the State Legislature of Kansas to develop a junior college program now in operation at Colby, Kansas. Completed the requirements for the Doctor of Education degree at Oklahoma State University in May, 1971.

Professional Experience: Employed in Nortonville Public Schools, Nortonville, Kansas, as a mathematics teacher and coach from 1950 to 1952; as a mathematics teacher and coach at Smith Center High School from 1952 to 1954; as a mathematics instructor and junior college basketball coach at El Dorado, Kansas in 1954 to 1955; as a basketball coach and mathematics instructor at Sherman Community High School, Goodland, Kansas, 1954 to 1957. Employed as a mathematics instructor and coach at Washburn Rural High School, Topeka, Kansas, 1957 to 1960. As a director of athletics and mathematics instructor at Campus High School, Wichita, Kansas, 1960 to 1962. As junior and senior high school principal at Olathe, Kansas, 1963 to 1965.

As superintendent of schools of Haysville, Kansas, 1965 to 1971. Granted a year's leave of absence for residence requirement at Oklahoma State University during the 1969-70 school year. Served in the United States Naval Air Forces from 1944 to 1946.

Professional Organizations: Kansas Association of School Administrators, American Association of School Administrators, Phi Delta Kappa, IDEA (Institute of Development of Educational Activities), Comparative Education Society.
