ENGAGE

Other Options Food Pantry • Midtown Community Center

ARCH 5226 – Comprehensive Studio – Architectural Engineering

Thesis Completed: May 10th, 2017

Submitted by: Eric Fleet

Course Abstract

I am designing a Food Pantry and Teen Community Center. The project design will be comprehensive, so I will be designing the overall building, mechanical systems, some technical details based on research and analysis, as well as an in-depth design and calculation of the structural system.

Personal Project Abstract

Historically, people with HIV/AIDS have felt disassociated with society, a stigma that is still very existent today. A strong interaction with the Oklahoma City community can provide this group of people with the acceptance and comfort that we all inherently desire. The opportunity to design a campus that integrates a food pantry with a community center provides a unique opportunity to chisel away at this stigma. Through creating architecturally separated, yet programmatically connected spaces, the building users experience a balance of both public and private spaces. Though the three primary users of this building are teens, staff, and the food pantry clients, it is the staff that ties the two polar building functions together and nurtures this overall connection to the community.

Engage is located on the corner of N. Robinson Avenue and N.W. 11th Street in Oklahoma City, a site with access to views toward the downtown and midtown areas. Users are invited inside through three main entrances, all located at strategic points across the site – one is more private and placed near the south bus stop for servicing primarily food pantry users, while the other two entrances pull people into the central lobby from the west and east sides of the site respectively. A central corridor accessed from the parking is utilized to help funnel staff and community center users into their respective spaces. The food pantry clients are symbolized through the use of precast concrete walls to express their resiliency and sense of reservation during this hard time. These clients have access to a more private set of spaces on the south side of the site, while the precast concrete walls continue throughout the building, interacting with spaces such as the teen lounge, the main lobby and the multipurpose classroom.

In contrast, teens will use the community center to the north, a more public and open set of spaces. This larger space is encapsulated by a planar wood façade with slots dispersed along its

surface for light access. The grand form serves to envelop the community center, engage the ground plane, and span across the building to interact with the food pantry and staff spaces. By moving up and interacting with the roof planes of both the gymnasium and the food pantry lobby, this large timber form begins to peel away pieces of the roof to reveal large skylights for allowing light penetration into the spaces below. Finally, by taking advantage of vertically aligned CMU walls, the loading and service spaces are clearly defined. As one moves around the building, these three contrasting materials begin to speak to one another and guide users throughout the building, highlighting the three primary users of the design.

The spaces may be separated by function, but various connections unify the building as a whole through the situation of the staff and the communication of differing materiality. The stigma against the HIV/AIDS community opposes what it means to even be a community. *Engage* promotes the entire community – all people – while still balancing the need for public and private spaces.

Pre-Design Phase

Project Research

Once the project parameters were introduced, I helped coordinate the entire comprehensive studio into a research endeavor to collect information on various aspects that would affect the overall design initiative. These areas of research were focused on the site given, the client's needs, the building codes of the area, the context of Oklahoma City, sustainability suggestions, effective loading scenarios, and the construction of a digital context model in Revit. After a week of intensive research collection and organization, a 175-page document was produced and dispersed amongst the class to help formulate some initial design proposals.

In addition to the strong focus on project research at the beginning of the semester, the class spent a day visiting the site in person, while also meeting our clients at Other Options Incorporated in Oklahoma City. This personal interaction helped to solidify the potential magnitude of our design on this facility that devotes everything to serving the community. As a requirement for the course, students were asked to volunteer one weekend at Other Options Inc. in order to experience the culture of the facility first hand. This experience also lent itself to allowing students to see any deficiencies in the current design so that solutions could begin to take shape early on in the design process.

Schematic Design Phase

Concept Search

The weeks following the pre-design phase were spent rigorously searching for an initial design concept that solved as many of the project challenges as possible. These concepts explored everything from site orientation and access of spaces, to massing and functionality of the loading dock. After several weeks of exploration and refinement, I honed in on a design concept that gave representation to the various user groups through the qualities of differing materials and how they can interact with one another. A general massing strategy was implemented that worked well programmatically with the spaces required and from there, the concept took over in making several important design decisions.

The initial schematic design process began with several inspiration pictures which led to a preliminary design concept. The idea of taking an important space and shifting it out of an overall, monolithic form provided a sense of hierarchy and intrigue. In addition, the use of contrasting materials around the façade allowed for flexibility in daylighting strategies while also creating an appealing exterior aesthetic.

Through the use of various conceptual communication methods such as sketching and Google Sketchup, the initial form of the design came into being. By altering the different mass configurations, scale was better understood and the relationships between masses was pinpointed. By looking into the programmatic relationships within each mass, the general plan was then able to function alongside the proposed 3D masses.

Once the main form was selected, ideas were explored that expressed the concept of community through exterior materiality. Finally, a scheme was chosen that symbolized the community center with a timber veneer, while the food pantry was represented by precast concrete walls.

SD HVAC

As the floor plans began to take shape, the location of the mechanical rooms and other service spaces had to be strategically placed in order to nurture a successful design. By placing the

service core of the building in the southeast corner near the loading dock, these spaces were kept away from the main spaces of the building and remain hidden from view. An initial duct layout was proposed which followed the central circulation of the design to a tee. This decision allowed for an extremely efficient selection of mechanical ductwork that provided the required amount of conditioned air to the spaces with the least amount of ducting material possible.

Intake and exhaust air vents were placed a minimum of 8 feet apart to avoid cross-contamination of these separate air streams. Three air handling units were chosen to service the building. Two of these units operate on a variable-air-volume system (VAV) and service the occupied spaces on the first and second floors. The third air handling unit services the gymnasium alone and runs on a constant-air-volume system (CAV) due to the large volume and height of this space. In addition, VAV boxes were modeled to indicate when a space would have its own thermostat for controlling the specific environmental conditions of that space.

The heating and cooling system chosen for this design was accomplished through the use of ground source heat pumps located at the southeast corner of the building. Typically, these pumps cannot be placed underneath the building in case the need for servicing these wells arises. However, after researching the successful implementation of this sub-building installation method, I chose to pursue this approach in order to save space on the limited size of our given site.

SD Structure

The structure was explored during the schematic design phase from a very general perspective. Different systems were implemented and various advantages and disadvantages were studied. First, a timber system was studied to check feasibility. Though this system would result in a more efficient use of materials and an overall lighter structure, the member sizes would have to be larger to accommodate for the weakness of the material itself. Next, a concrete design was chosen, utilizing a one-way concrete slab. This approach provided minimal column footprints due to the strength of the material; however, the system would have resulted in fewer views out of the building, less daylight exposure, and a heavy roof load. Finally, a complete steel system was chosen for this design due to its strength, flexibility in design, and simplicity in installation. By using steel vertical braces, all lateral forces could be transferred into the foundation directly

without the use of solid shear walls. A composite floor system was selected as well due to its strength and minimal thickness requirements.

Design Development Phase

Material Exploration

Before the design development phase, many of the major decisions that directed the form of the building had already been made. After the introduction to the design development phase, weeks were spent developing the interior experience of the design, as well as refining the interaction between both the interior and exterior materials. For my concept, the exterior materials represented the primary users of the building. However, during this phase, I integrated this concept throughout the spaces within, guiding the timber veneer drop-panels along a hallway while the precast concrete walls rose from the floor plane and began to enclose various volumes. In addition to expanding the use of the three main materials along the inner corridors, a stained concrete floor was utilized on the second floor to richen the community center areas and warm the gathering spaces. Also, acoustic drop panels were placed below the structure, the mechanical air ducts, and the fire protection system to provide noise control and scale to the community center.

Lighting design was also initiated during this phase. By utilizing the Lumen method, multiple lighting fixtures were researched and run through a trial and error process until one met the required lighting proficiencies. Once a fixture was selected after numerous calculations, the dimensions and spacing were included in a reflected ceiling plan to ensure complete coordination with the structural, fire protection, and HVAC systems for the building. To account for the effects of daylighting, a scale model was built and tested in our daylighting lab. Using eight sensors placed throughout the model, the typical light loads were recorded and analyzed. By checking for the predicted illuminance levels in the teen lounge during each of the four seasons, it was found that an internal shading device would be necessary during the summer months to help control the amount of daylight entering the space. Therefore, a mechanical roller blind system was placed in the detailed wall section and the interior rendering of the teen lounge.

DD HVAC

Before constructing an environmental performance model in the EnergyQuest program, the thermal resistance values had to be calculated for the roof, wall, and floor components. In addition, research was performed to find a glass type for the curtain wall that diffused the daylight sufficiently and provided thermal protection to the space within. Several values were recorded for the various thermal-resisting components such as the thermal conductance, thermal transmittance, glass shading coefficient, the solar heat gain coefficient, and the visible transmittance of the glass. By comparing my model with a 27% glass ratio to a baseline model with a 40% glass ratio, my design was found to be much more efficient and required a lower cooling load for the interior space. With these calculations, the main duct sizes were determined for each air handling unit, as well as the return duct sizes. Louver sizes were also found through calculations utilizing the air handling unit capacities and a 30% fresh air intake.

DD Structure

After proceeding through the schematic design phase of this project, my design was made possible by utilizing a structural steel framing system. With this material, overall depths of members were reduced when compared to the use of timber construction. In addition, visual connections between the interior space and the exterior environment were more readily available when compared to the use of concrete columns and slabs.

Upon reviewing the geotechnical report for our urban site in the heart of Oklahoma City, it was advised that a foundation system consisting of drilled piers and grade beams supporting a concrete slab for the ground floor would be the best option. This would result in the least amount of overall building movement when compared to slab-on-grade or subgrade wall systems. These drilled piers would also support a system of grade beams beneath the structure, which are located around the exterior walls of the building. They function by transferring gravity load directly from the columns above to the piers below.

Preliminarily, an 18-inch diameter pier would be drilled below all columns, with the exception of some localized areas across the site with an expected increase in gravity loading. Some instances of this occurring would be below the green roof since live and dead loads here will be higher when compared to other locations around the building. Piers located beneath the south side of the gymnasium, as well as in the middle of the Food Pantry space that extend upward to support

the staff spaces on the second floor, should be sized near 24 inches or 30 inches in diameter to accommodate higher dead loads and large roof loads above the gymnasium.

The main horizontal structural system for this project is a composite deck system supported by steel post and beam construction. Steel columns and vertical bracing throughout the building support horizontal composite steel beams, whose purpose is to tie together the poured concrete slab, the corrugated steel decking, and the steel beams beneath. Before a three-inch concrete slab is poured, shear studs are attached to the deck/beam interface so that the concrete slab engages the structure itself. Vertical bracing (in the form of diagonal braces) is located primarily around the large gym space, as well as along the mechanical cores in the building and along the south side of the second floor staff spaces. These walls act as the main lateral force resisting elements for the design.

Sizing of the members throughout this design remains relatively consistent within each space. The gym is sheltered above by open-web joist girders, approximately six feet deep. These in turn support one-foot deep open-web roof joists, spaced at approximately five feet on center. Most columns were preliminarily designed to be wide flange members with a nominal depth of eight to ten inches. For the food pantry component of the program, open-web joist girders reaching a depth of three feet were used to support the green roof above. In addition, fourteeninch deep steel roof beams comprise the exterior framing of the food pantry.

Design Documentation Phase

Construction Documents

As final documentation took place in the design process, numerous revisions were made to the structure to finalize the structural analysis model. In RISA, the structure was modeled and made stable after applying all the necessary seismic, wind, snow, and gravity loads to the building. Once the model ran successfully, various checks were performed to meet code and serviceability requirements such a lateral drift checks, member deflection checks, and interaction equation checks. Once the final member sizes were selected, the Revit model went through one final revision before construction documents were created.

Fleet 9

For the documentation process, an index was formed that lists the typical drawings included if the project were being built by professional architects and engineers. I only developed a specific selection of these drawings for documentation as a structural engineering undergraduate. A detailed architectural plan was created, showing the various room numbers, associated door numbers, interior partition labels, and several interior elevation markers. From here, the foundation and framing plans came to life, providing layouts and details on brace locations, column and pier placements, edge of slab boundaries, slab elevations, and member sizes. Details for some of the specific structural connections were drawn throughout the building, showing different framing scenarios, the elevator pit detail, and the expansion joint detail. In order to quantify members and their sizes for the building, the final sheet on the construction drawings was devoted to schedules. Numerous calculations were performed here and the sizes of the main structural members were organized in tables such as the piers, grade beams, columns, beams, girders, slabs, and vertical braces.

Conclusion

Overall, the Architectural Engineering Comprehensive Design Studio course was a culmination of the last five years of my architecture and engineering education. Though the course curriculum is nearly identical for the architects and the engineers in this class, the engineers focused more on the structural components of their design rather than the architectural details. Since our major has a strict focus on structures, I personally feel like the course could be even more attuned to the structural engineering aspect of the profession than it currently is. The course places a heavy emphasis on the HVAC building system, but our degree does not have a focus in this area. If we had even just a couple more weeks to develop our individual structures and explore the RISA modeling software more in depth, the experience of completing this comprehensive design studio would be even more worthwhile. Nevertheless, the design experience that I have received through the School of Architecture at Oklahoma State University will be a valuable asset in my professional career in the years to come.

PROJECT STATEMENT / ABSTRACT:

HISTORICALLY, PEOPLE WITH HIV/AIDS HAVE FELT DISASSOCIATED WITH SOCIETY, A STIGMA THAT IS STILL VERY EXISTENT TODAY. A STRONG INTERACTION WITH THE OKLAHOMA CITY COMMUNITY CAN PROVIDE THIS GROUP OF PEOPLE WITH THE ACCEPTANCE AND COMFORT THAT WE ALL INHERENTLY DESIRE. THE OPPORTUNITY TO DESIGN A CAMPUS THAT INTEGRATES A FOOD PANTRY WITH A COMMUNITY CENTER PROVIDES A UNIQUE OPPORTUNITY TO CHISEL AWAY AT THIS STIGMA. THROUGH CREATING ARCHITECTURALLY SEPARATED, YET PROGRAMMATICALLY CONNECTED SPACES, THE BUILDING USERS EXPERIENCE A BALANCE OF BOTH PUBLIC AND PRIVATE SPACES. THOUGH THE THREE PRIMARY USERS OF THIS BUILDING ARE TEENS, STAFF, AND THE FOOD PANTRY CLIENTS, IT IS THE STAFF THAT TIES THE TWO POLAR BUILDING FUNCTIONS TOGETHER AND NURTURES THIS OVERALL CONNECTION TO THE COMMUNITY.

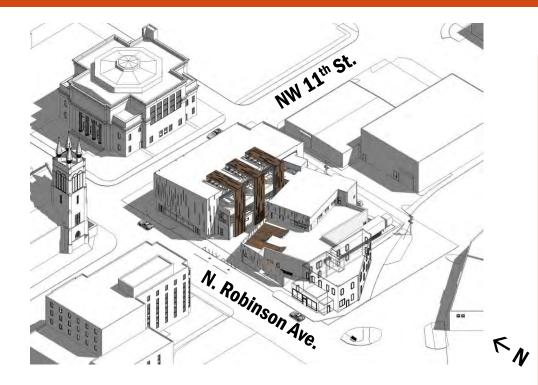

ENGAGE IS LOCATED ON THE CORNER OF N. ROBINSON AVENUE AND N.W. 11TH STREET IN OKLAHOMA CITY, A SITE WITH ACCESS TO VIEWS TOWARD THE DOWNTOWN AND MIDTOWN AREAS. USERS ARE INVITED INSIDE THROUGH THREE MAIN ENTRANCES, ALL LOCATED AT STRATEGIC POINTS ACROSS THE SITE – ONE IS MORE PRIVATE AND PLACED NEAR THE SOUTH BUS STOP FOR SERVICING PRIMARILY FOOD PANTRY USERS, WHILE THE OTHER TWO ENTRANCES PULL PEOPLE INTO THE CENTRAL LOBBY FROM THE WEST AND EAST SIDES OF THE SITE RESPECTIVELY. A CENTRAL CORRIDOR ACCESSED FROM THE PARKING IS UTILIZED TO HELP FUNNEL STAFF AND COMMUNITY CENTER USERS INTO THEIR RESPECTIVE SPACES. THE FOOD PANTRY CLIENTS ARE SYMBOLIZED THROUGH THE USE OF PRECAST CONCRETE WALLS TO EXPRESS THEIR RESILIENCY AND SENSE OF RESERVATION DURING THIS HARD TIME. THESE CLIENTS HAVE ACCESS TO A MORE PRIVATE SET OF SPACES ON THE SOUTH SIDE OF THE SITE, WHILE THE PRECAST CONCRETE WALLS CONTINUE THROUGHOUT THE BUILDING, INTERACTING WITH SPACES SUCH AS THE TEEN LOUNGE, THE MAIN LOBBY AND THE MULTIPURPOSE CLASSROOM.

IN CONTRAST, TEENS WILL USE THE COMMUNITY CENTER TO THE NORTH, A MORE PUBLIC AND OPEN SET OF SPACES. THIS LARGER SPACE IS ENCAPSULATED BY A PLANAR WOOD FAÇADE WITH SLOTS DISPERSED ALONG ITS LENGTH FOR LIGHT ACCESS. THE GRAND FORM SERVES TO ENVELOP THE COMMUNITY CENTER, ENGAGE THE GROUND PLANE, AND SPAN ACROSS THE BUILDING TO INTERACT WITH THE FOOD PANTRY AND STAFF SPACES. BY MOVING UP AND INTERACTING WITH THE ROOF PLANES OF BOTH THE GYMNASIUM AND THE FOOD PANTRY LOBBY, THIS LARGE TIMBER FORM BEGINS TO PEEL AWAY PIECES OF THE ROOF TO REVEAL LARGE SKYLIGHTS FOR ALLOWING LIGHT PENETRATION INTO THE SPACES BELOW. FINALLY, BY TAKING ADVANTAGE OF VERTICALLY ALIGNED CMU WALLS, THE LOADING AND SERVICE SPACES ARE CLEARLY DEFINED. AS ONE MOVES AROUND THE BUILDING, THESE THREE CONTRASTING MATERIALS BEGIN TO SPEAK TO ONE ANOTHER AND GUIDE USERS THROUGHOUT THE BUILDING, HIGHLIGHTING THE THREE PRIMARY USERS OF THE DESIGN.

THE SPACES MAY BE SEPARATED BY FUNCTION, BUT VARIOUS CONNECTIONS UNIFY THE BUILDING AS A WHOLE THROUGH THE SITUATION OF THE STAFF AND THE COMMUNICATION OF DIFFERING MATERIALITY. THE STIGMA AGAINST THE HIV/AIDS COMMUNITY OPPOSES WHAT IT MEANS TO EVEN BE A COMMUNITY. *ENGAGE* PROMOTES THE ENTIRE COMMUNITY – ALL PEOPLE – WHILE STILL BALANCING THE NEED FOR PUBLIC AND PRIVATE SPACES.

THIS SEMESTER, THE ARCH 5226 ARCHITECTURAL COMPREHENSIVE ENGINEERING DESIGN STUDIO WAS TASKED WITH DESIGNING A FOOD PANTRY AND TEEN COMMUNITY CENTER LOCATED IN THE HEART OF DOWNTOWN OKLAHOMA CITY. OUR CLIENT, OTHER OPTIONS INC., PROVIDES BASIC FOOD ESSENTIALS TO HIV-POSITIVE MEMBERS OF THE METRO THIS GROUP OF PEOPLE AREA. CREATED A DESIGN CHALLENGE SINCE THE IDEA OF PRIVACY NEEDED STRONG CONSIDERATION. IN ADDITION, IT WAS REQUESTED THE THAT TEEN COMMUNITY CENTER BE A SAFE HAVEN FOR TEENS, BUT SPECIFICALLY FOR LGBT YOUTH. THIS MARGINALIZED GROUP OF YOUNG PEOPLE IS AT HIGH RISK FOR HOMELESSNESS. TOGETHER, THIS CAMPUS NEEDED TO TIE INTO THE URBAN COMMUNITY, AS WELL AS EXPRESS A BALANCE BETWEEN THE PUBLIC AND PRIVATE.

AERIAL PLAN SHOWING CONTEXT, SCALE, AND THE VERTICALITY OF THE TIMBER SKIN DESIGN

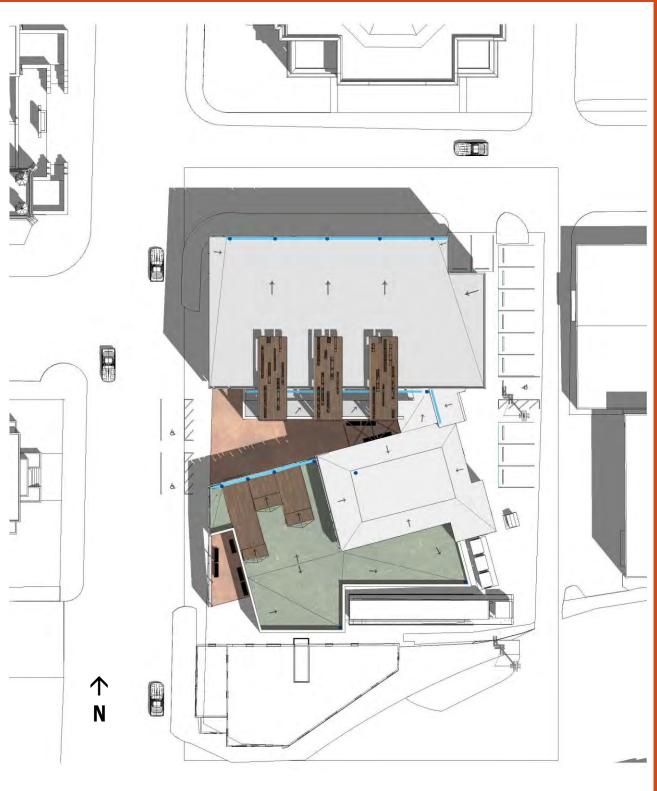

OVERALL CONTEXT AND SITE LOCATION. OKLAHOMA CITY, OKLAHOMA – MIDTOWN DISTRICT

OUR SITE WAS LOCATED AT THE INTERSECTION OF NW 11TH STREET AND NORTH ROBINSON AVENUE. TO THE NORTH, AN ABANDONED CHURCH BUILDING OBSTRUCTED MOST VIEWS IN THAT DIRECTION. SIMILARLY, AN AUTOMOTIVE WORKSHOP RESTS TO THE EAST ACROSS FROM A UTILITY SERVICE ALLEY.

ALONG THE CURVED ROAD TO THE SOUTH LIE SEVERAL WAREHOUSES, USED PRIMARILY FOR FLOWER DISTRIBUTION. THIS STREET SEES A LARGE NUMBER OF SEMITRUCKS EVERY DAY, SO THE CONNECTION TO THE SERVICE ALLEY HERE IS VERY USEFUL FOR THIS DESIGN.

TOWARD THE WEST, THE STRYKER OFFICE BUILDING RISES SEVERAL STORIES, IMPEDING MOST VIEWS IN DIRECTION. THAT ADDITIONALLY, THE FIRST BAPTIST CHURCH ON THE NORTHWEST CORNER OF INTERSECTION IS THE AESTHETICALLY APPEALING, BUT RISES FAR ABOVE MOST OTHER BUILDINGS IN THE SURROUNDING AREA.

THE INITIAL SCHEMATIC DESIGN PROCESS BEGAN WITH SEVERAL INSPIRATION PICTURES WHICH LED TO A PRELIMINARY DESIGN CONCEPT. THE IDEA OF TAKING AN IMPORTANT SPACE AND SHIFTING IT OUT OF AN OVERALL, MONOLITHIC FORM PROVIDES A SENSE OF HIERARCHY AND INTRIGUE. IN ADDITION, THE USE OF CONTRASTING MATERIALS AROUND THE FAÇADE ALLOWS FOR FLEXIBILITY IN DAYLIGHTING STRATEGIES WHILE ALSO CREATING AN APPEALING EXTERIOR AESTHETIC.

THROUGH THE USE OF VARIOUS CONCEPTUAL COMMUNICATION METHODS SUCH AS SKETCHING AND GOOGLE SKETCHUP, THE INITIAL FORM OF THE DESIGN CAME INTO BEING. BY ALTERING THE DIFFERENT MASS CONFIGURATIONS, SCALE WAS BETTER UNDERSTOOD AND THE RELATIONSHIPS BETWEEN MASSES WAS PINPOINTED. BY LOOKING INTO THE PROGRAMMATIC RELATIONSHIPS WITHIN EACH MASS, THE GENERAL PLAN WAS THEN ABLE TO FUNCTION ALONGSIDE THE PROPOSED 3D MASSES.

ONCE THE MAIN FORM WAS SELECTED, IDEAS WERE EXPLORED THAT EXPRESSED THE CONCEPT OF COMMUNITY THROUGH EXTERIOR MATERIALITY. FINALLY, A SCHEME WAS CHOSEN THAT SYMBOLIZES THE COMMUNITY CENTER WITH A TIMBER VENEER, WHILE THE FOOD PANTRY IS REPRESENTED BY PRECAST CONCRETE. THESE RENDERINGS SHOW THE FINAL STAGES OF THE SCHEMATIC DESIGN PHASE.

AS THE DESIGN PROGRESSED, BUILDING CODES HAD TO BE MAINTAINED. NUMEROUS CHECKS WERE PERFORMED ACCORDING TO THE INTERNATIONAL BUILDING CODE 2012 (IBC). OCCUPANCY LOADS WERE CALCULATED, WHICH ALLOWED FOR FURTHER CALCULATIONS TO DETERMINE THE WIDTH OF EGRESS ELEMENTS, THE NUMBER OF EXITS REQUIRED, AND ALL EXIT TRAVEL DISTANCES.

STRATIFIED TIMBER PANELING

PRECAST ARCHITECTURAL CONCRETE PANEL WALLS

CONCRETE MASONRY UNIT WALL SYSTEM

ERIC FLEET

ARCH 5226 - HONORS

THE EXTERIOR EXPRESSION OF THE DESIGN DIRECTLY RELATES TO THE DESIGN CONCEPT OF OUR THREE PRIMARY SPACES AND USERS. MASONRY CONCRETE UNITS ENCASE THE SERVICE AND LOADING ZONES IN THE SOUTHEAST CORNER OF THE BUILDING NEAR THE LOADING DOCK. THE FOOD PANTRY IS REPRESENTED BY PRECAST CONCRETE WALLS AND SYMBOLIZES THE **CLIENTS' RESILIENCE AND RESERVATION. AS** THIS MATERIAL MOVES NORTH INTO THE COMMUNITY CENTER, THE TIMBER PANELING FACADE **BEGINS TO EMBRACE AND ENGAGE OPPOSING** DURABLE THIS MATERIAL. AS THE WOOD ENCOMPASSES PORTIONS OF THE **BUILDING, IT EXPOSES NUMEROUS** SKYLIGHTS ON THE ROOF PLANES, AS WELL AS ENFORCES THE CONCEPT OF ENCOURAGING A COMMUNITY THAT EMBRACES ALL.

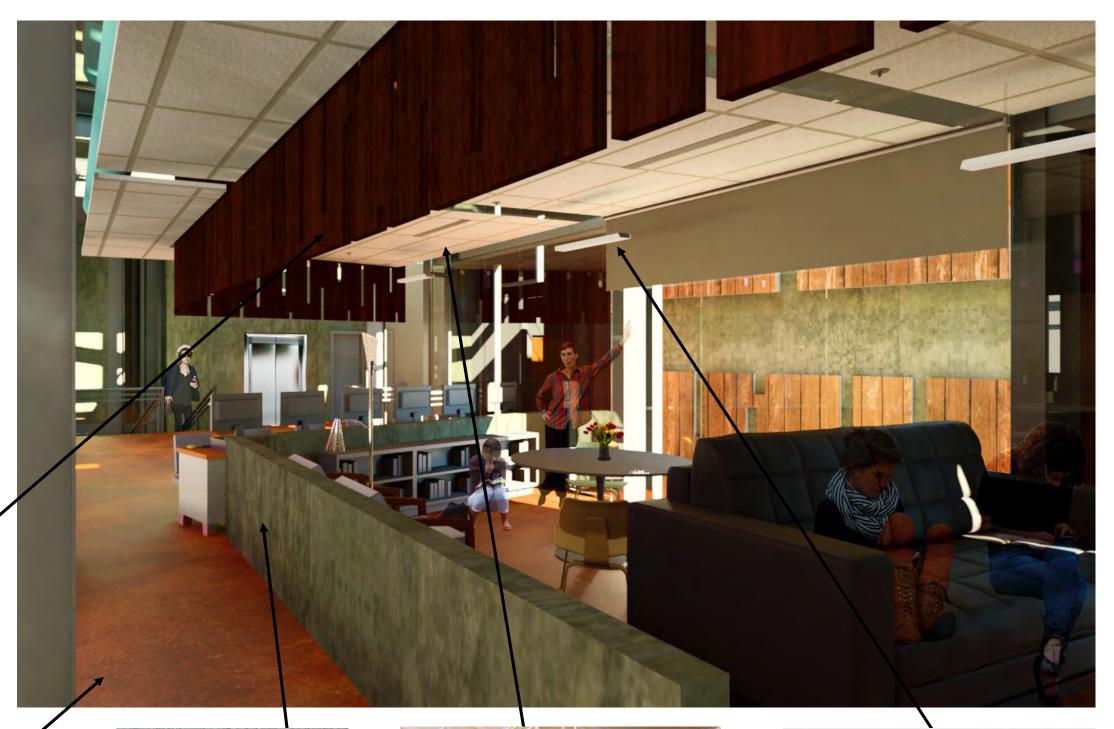

ARCH 5226 - HONORS

A FOCUS SPACE WAS SELECTED IN ORDER TO EXPLORE THE ROLE OF THE INTERIOR QUALITY OF THE SPACE. THE TEEN LOUNGE WAS CHOSEN DUE TO ITS STRATEGIC LOCATION FOR DAYLIGHTING, AND BECAUSE IT STRONGLY EXHIBITS HOW THE DIFFERENT MATERIALS INTERACT. AS SHOWN, THE PRE-CAST CONCRETE SEPARATES THE SPACE FROM THE COMPUTER LOUNGE, WHILE THE TIMBER DROP PANEL WALL TIES THE LOUNGE BACK INTO THE OVERALL FLOW OF THROUGHOUT THE TRAFFIC BUILDING. A STAINED CONCRETE FLOOR WAS CHOSEN TO AID THE WOOD IN WARMING THE INSIDE SPACE AND ACOUSTIC DROP CEILING PANELS SCALE THE LOUNGE DOWN WHILE HIDING THE FIRE PROTECTION AND HVAC SYSTEMS ABOVE.

BY CONSULTING REFERENCE DOCUMENTS FROM ASHRAE (AMERICAN SOCIETY OF HEATING, REFRIGERATING, AND AIR-CONDITIONING ENGINEERS), THE THERMAL **RESISTANCE VALUES WERE FOUND FOR EACH** MATERIAL PRESENT ALONG THE PERIMETER OF THE TEEN LOUNGE SPACE, SUCH AS THE FLOOR, THE WALL, AND THE ROOF ABOVE. U-VALUE, OR THE THERMAL CAN THEN TRANSMITTANCE, BE DETERMINED BY DIVIDING 1 BY THE SUM OF THE RESISTANCE VALUES FOR THAT ELEMENT. THE TABLE TO THE RIGHT SHOWS THE VARIOUS COMPONENTS OF THESE THREE MAIN ELEMENTS, AS WELL AS THEIR DISTINCT R-VALUES FROM ASHRAE. IN ORDER TO DETERMINE THE THERMAL EFFICIENCY OF THE GLASS CHOSEN AND THE SYSTEMS UTILIZED, THESE VALUES WERE THEN PLUGGED INTO THE COMPUTER MODELING PROGRAM EQUEST AND AN ANALYSIS WAS PERFORMED.

2. Orie

According to your selected focus space, this space is facing: (North), (East), (South), (West)

3. Results of Energy Simulation Perimeter Thermal Zone:

August 27th, 4:00 pm • Time of the maximum cooling load (day and hour)

- Compare the cooling load (CFM/sq.ft) to your reference design (baseline) :1.223.
- What is the energy saving (%), compared to baseline: 24.03

Interior Thermal Zone:

- July 16th, 3:00 pm • Time of the maximum cooling load (day and hour)
- Maximum Cooling load per Square Foot = (4.488)*1000 / 300 = ((.....11.22)) Btuh/sq.ft.
- ^a Assuming Supply Air temperature equals 55°F to room temperature of 75°F

Remember, for complete documentation, you must attach a copy of your envelope design (wall section), peak cooling results from eQuest (two tables), and glass performance data to this form.

A BASELINE MODEL WAS MADE IN EQUEST WITH A 40% GLASS RATIO ON THE EXTERIOR WALL. THE ANALYSIS WAS RUN AND FOUND THE SPECIFIC COOLING LOADS REQUIRED TO KEEP THE INTERIOR AND EXTERIOR THERMAL ZONES AT A COMFORTABLE TEMPERATURE. TO COMPARE, MY DESIGN UTILIZED A SMALLER GLASS RATIO OF 27% WHILE ALSO EXHIBITING VERTICAL TIMBER SHADING DEVICES. THIS PROVED TO BE AN EFFICIENT THERMAL SYSTEM, REQUIRING LESS ENERGY TO PUMP COOL AIR INTO THE LOUNGE. FROM HERE, THE SIZE OF THE AIR HANDLING UNITS, SUPPLY AND RETURN DUCTS, AND FRESH AIR LOUVERS WAS DETERMINED BY USING A DUCTILATOR AND SIMPLE CALCULATIONS.

ARCH 4216/5226 & 4263 **HVAC REVIEW CHECKLIST. DD.**

BUILDING SYSTEMS COORDINATION in THE DESIGN DEVELOPMENT PHASE Due Date: Friday, March 31st, 2017, 5:00 p.m. (for review only).

To help you being organized during the design development phase, and keep track of your project's **PROGRESS**, please fill in this worksheet. Refer to the list of required tasks, read it carefully, and feel free to ask questions. A mandatory final review of your building's energy efficiency, the coordination of building systems with architecture, and the ductwork layout will take place during the week of March 20th. Everyone is expected to be prepared for this mandatory review (sign up in the sign-up sheet).

THE RED AND BLUE DUCT LAYOUT PLANS ARE VAV (VARIABLE AIR VOLUME) SYSTEMS, WHERE EACH ROOM HAS AT LEAST ONE THERMOSTAT TO CONTROL SPECIFIC THERMAL ITS ENVIRONMENT. THE VAV BOXES ARE SHOWN IN YELLOW FOR EACH SPACE. IN ADDITION, THE THREE FAN ROOMS IN THIS DESIGN HOLD THE BUILDING'S AIR HANDLING UNITS, AS WELL AS PROVIDE A SPACE FOR THE SUPPY AND RETURN DUCTS, FRESH AIR INTAKE, AND EXHAUST AIR.

THE GYMNASIUM IN PURPLE IS RUN ON A CAV (CONSTANT AIR VOLUME) SYSTEM. THIS STRATEGY WAS CHOSEN SINCE THE SPACE IS LARGE AND THE DUCT WORK MUST SERVICE SUCH A TALL ROOM. LUCKILY, THE SIZE OF DUCTS IN THIS ROOM WAS ABLE TO BE LOWERED SINCE THE AIR HANDLING UNIT ONLY SERVICES THIS ONE SPACE.

CALCULATIONS FOR THE LOUVER SIZES WERE PERFORMED IN EXCEL AND WERE BASED ON THE CAPACITY REQUIRED OF THAT SPECIFIC AIR HANDLING UNIT. SINCE THESE LOUVERS MUST BE LOCATED A MINIMUM OF 8 FEET APART TO AVOID EXHAUST AND FRESH AIR CONTAMINATION, THE LOUVERS WERE PLACED AROUND A CORNER TO DECREASE THIS SPACING. THE 3D HVAC AXONOMETRIC HERE SHOWS THE TYPICAL LOCATION OF DIFFUSERS ALONG EACH DUCT SYSTEM. A 2 INCH, 2 SLOT DIFFUSER WAS SELECTED FOR MOST INTERIOR SPACES DUE TO ITS AESTHETIC APPEAL AND PERFORMANCE CRITERIA FROM TITUS.

2ND FLOOR SERVICE PLAN

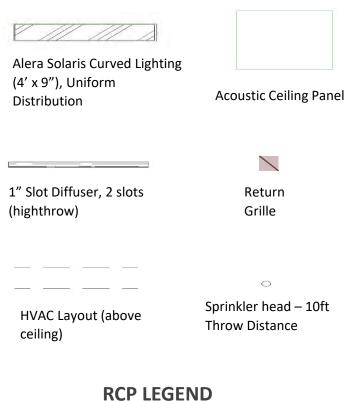

17

BUILDING CODE PUTS MANY RESTRICTIONS ON THE SERVICE SPACES OF A BUILDING, INCLUDING MECHANICAL ROOMS, ELECTRICAL CLOSETS, AND ELEVATOR ROOMS. THE ELECTRICAL CLOSETS MUST BE WITHIN 100 FEET OF EACHOTHER TO AVOID EXTENSIVE BRANCH CIRCUIT CABLE LENGTHS. GROUND SOURCE HEAT PROVIDE PUMPS THE BUILDING WITH HEATING AND COOLING, AND ARE LOCATED NEAR THE FIRST FLOOR MAIN MECHANICAL FAN ROOM. THE EXTERIOR TRANSFORMER IS ALSO LOCATED NEAR THE MAIN ELECTRICAL CLOSET ON THE FIRST FLOOR NEAR THE PARKING. FINALLY, DUMPSTERS WERE PLACED NEAR THE LOADING ZONE FOR AN EFFICIENT SERVICE TRUCK SYSTEM.

IN ORDER TO MEET BUILDING CODE AND PROVIDE AN ADEQUATE AMOUNT OF ARTIFICIAL LIGHT IN THE TEEN LOUNGE, CALCULATIONS WERE PERFORMED TO TEST VARIOUS LIGHTING TYPES. AFTER MULTIPLE ATTEMPTS AT FINDING A DESIGN THAT WORKED, THE ALERA SOLARIS CURVED LIGHTING LUMINAIRE WAS CHOSEN DUE TO ITS SLEEK FORM AND STRONG LUMEN OUTPUT. THIS WAS INTEGRATED WITH THE HVAC, FIRE PROTECTION, STRUCTURAL, AND ACOUSTIC SYSTEMS IN THE TEEN LOUNGE TO PROVIDE LIGHT COVERAGE TO THE ENTIRE AREA OF THE SPACE. THIS SYSTEMS INTEGRATION CAN BE SEEN IN THE REFLECTED CEILING PLAN ABOVE.

FEATURES

· Optional distribution covers allow the designer to maintain a single look throughout a facility while varying the light distribution • Direct/Indirect distribution

Solaris

EXPRESS

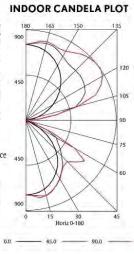

- . TB, T5, or T5HO lamps
- · Heavy 20-gauge steel construction provides excellent housing rigidity
- · Controls compatible
- Adjustable 48" (CM48) aircraft cable yoke hanger with vertical and horizontal balancing · Patented die cast couplers and end caps ensure
- straight rows with no light leak
- · Fixed louver stays in housing, even if fixture is struck or damaged Popular for educational and general office
- commercial facilities, also excellent for retail

AN ANALYSIS WAS PERFORMED IN THE ARCHITECTURE DAYLIGHTING LAB IN ORDER TO DETERMINE THE DAYLIGHT QUALITIES OF A TEEN LOUNGE SCALE MODEL. FOR CERTAIN ILLUMINATION LEVELS THROUGHOUT THE YEAR (SUMMER, WINTER, AND SPRING/FALL), 3 ILLUMINANCE CURVES WERE GRAPHED AND COMPARED. WITH THIS DATA OBTAINED FROM THE 8 SENSORS USED, IT WAS DETERMINED THAT THE ILLUMINATION LEVEL IN THE TEEN LOUNGE DURING THE SUMMER MAY BE SLIGHTLY TOO HARSH, SO MECHANICAL ROLLER BLINDS WERE INSTALLED IN THE DESIGN TO RESOLVE THIS PROBLEM.

AFTER THE SCHEMATIC DESIGN PHASE, A STRUCTURAL STEEL FRAMING SYSTEM WAS CHOSEN FOR THE DESIGN. WITH THIS MATERIAL, OVERALL DEPTHS OF MEMBERS WOULD BE REDUCED. IN ADDITION, VISUAL CONNECTIONS BETWEEN THE INTERIOR AND THE EXTERIOR REMAIN UNIMPEDED.

UPON REVIEWING THE GEOTECHNICAL REPORT FOR THE OKLAHOMA CITY SITE, IT WAS ADVISED THAT A FOUNDATION SYSTEM CONSISTING OF DRILLED PIERS AND GRADE BEAMS SUPPORTING A CONCRETE SLAB FOR THE GROUND FLOOR WOULD BE THE BEST OPTION. THIS WOULD RESULT IN THE LEAST AMOUNT OF OVERALL BUILDING DRIFT. THESE DRILLED PIERS ALSO SUPPORT A SYSTEM OF GRADE BEAMS BENEATH THE STRUCTURE, WHICH ARE LOCATED AROUND THE EXTERIOR WALLS OF THE BUILDING.

PRELIMINARILY, AN 18 INCH DIAMETER PIER WOULD BE DRILLED BELOW ALL COLUMNS, WITH THE EXCEPTION OF SOME LOCALIZED AREAS WITH AN EXPECTED INCREASE IN GRAVITY LOADING, SUCH AS BELOW THE GREEN ROOF, BENEATH THE SOUTH SIDE OF THE GYMNASIUM, AND IN THE MIDDLE OF THE FOOD PANTRY SPACE THAT EXTENDS UPWARD TO SUPPORT THE STAFF SPACES ON THE SECOND FLOOR. THESE PIERS WERE EXPECTED TO BE SIZED NEAR 24 INCHES IN DIAMETER.

THE MAIN HORIZONTAL STRUCTURAL SYSTEM WAS A COMPOSITE DECK SYSTEM SUPPORTED BY STEEL POST AND BEAM CONSTRUCTION. STEEL COLUMNS AND VERTICAL BRACING THROUGHOUT THE BUILDING SUPPORT HORIZONTAL COMPOSITE STEEL BEAMS, WHOSE PURPOSE IS TO TIE TOGETHER THE POURED CONCRETE SLAB, THE CORRUGATED STEEL DECKING, AND THE STEEL BEAMS BENEATH. BEFORE A THREE INCH CONCRETE SLAB IS POURED, SHEAR STUDS ARE ATTACHED TO THE DECK/BEAM INTERFACE SO THAT THE CONCRETE SLAB ENGAGES THE STRUCTURE ITSELF. VERTICAL BRACING (IN THE FORM OF DIAGONAL BRACES) WAS LOCATED PRIMARILY AROUND THE LARGE GYM SPACE, AS WELL AS ALONG MECHANICAL CORES IN THE BUILDING AND ALONG THE SOUTH SIDE OF THE SECOND FLOOR STAFF SPACES. THESE WALLS ACT AS THE MAIN LATERAL FORCE RESISTING ELEMENTS FOR THE DESIGN.

SIZING OF MEMBERS THROUGHOUT THIS DESIGN REMAINS RELATIVELY CONSISTENT WITHIN EACH SPACE. THE GYM IS SHELTERED ABOVE BY OPEN-WEB JOIST GIRDERS, APPROXIMATELY SIX FEET DEEP. THESE IN TURN SUPPORT ONE-FOOT DEEP OPEN-WEB ROOF JOISTS, SPACED AT APPROXIMATELY FIVE FEET ON CENTER. MOST COLUMNS WERE PRELIMINARILY DESIGNED TO BE WIDE FLANGE MEMBERS WITH A NOMINAL DEPTH OF SIX INCHES, HOWEVER, THIS SIZING WAS EXPECTED TO INCREASE AS THE DESIGN DEVELOPED. FOR THE FOOD PANTRY COMPONENT OF THE PROGRAM, OPEN-WEB JOIST GIRDERS REACHING A DEPTH OF THREE FEET WERE USED TO SUPPORT THE GREEN ROOF ABOVE. IN ADDITION, FOURTEEN-INCH DEEP STEEL ROOF BEAMS COMPRISE THE EXTERIOR FRAMING OF THE FOOD PANTRY.

SECTION 1: GENERAL INFORMATION AND DESIGN CRITERIA

SECTION 1.1 - DOCUMENTS

1.1.1 Structural Construction Documents consist of Project Specifications and Structural Drawings. Structural drawings include General Notes and Typical details in addition to plans, sections and detail

1.1.2 General Notes and Typical Details describe general criteria that apply to all similar conditions throughout the project regardless of whether or not they are specifically referenced in the plans. nced in the plans or details.

1.1.3 Do not scale plans, details and sections for quantity, length or fit of materials.

1.1.4 The structural documents are protected by U.S.A. Copyright Laws. They shall not be used for any purpose other than construction of the structure shown on the site indicated on the Architectural Drawings. 1.1.5 The design represented by these documents is valid only for the building site and the purposes shown on the Architectural Drawings.

11.6 The GEOTECHNICAL REPORT is a separate document (not part of contract documents) furnished by the project owner. The contractor is urged to obtain a copy of the report for reference as it describes sub-surface conditions that may be encountered during installation of foundations and contains other information pertinent to construction of the project.

1.1.7 The contractor must coordinate Structural Documents with other trades and disciplines including, architectural, mechanical, electrical, HVAC and fire protection. Every attempt is made to coordinate drawings prior to issue, however, some requirements are not known prior to issue, and change may occur during construction as layout and fabrication drawings are developed.

1.1.8 Promptly report deviations and interferences with structural components for resolution by the Enginee

1.1.9 Verify dimensional location and depth of slab recesses and offsets with Architectural Drawings.

Verify weights, location and details of structurally supported mechanical equipment prior to on of the supporting structure. Report deviations from assumed conditions to the Engineer vicenting methods. 1.1.10 construction of the supportin prior to fabricating materials.

1 Verify the location, size and detail of roof openings and curbs for mechanical equipment prior to ating materials. Report deviations from assumed conditions to the Engineer before proceeding with

Verify location and size of floor and roof penetrations and sleeves for mechanical and omponents. Openings in beams, girders, columns and slabs must be submitted for approval. 1112

1.1.13 Heights of floor and roof decks and various framing components are given on the drawings relative to a reference elevation of 100-0". This reference elevation is equivalent to a Mean Sea Level Elevation of 594 00.

SECTION 1.2 - CODES AND STANDARDS

1.2.1 Building Code of jurisdiction: 2015 International Building Code

1.2.2 Structural Concrete Code - American Concrete Institute (ACI) 318-08

1.2.3 Structural Steel Code - American Institute of Steel Construction 14th Edition

1.2.4 Structural Design Code - American Society of Civil Engineers (ASCE) 7-10

SECTION 1.3 - DESIGN LOADS

1.3.1 Live Loads:

Public Stairs		100	psf	
Assembly, Lobbies		100	psi	
Automobile Parking	50	psf		
Corridors	100	psf		
Kitchen		100	psf	
Light Storage		125	psf	
Mechanical Room		150	psf	
Offices, Typical Floors	50	psf		
Roof, All Slopes		20	psf	
Terraces, Pedestrian		100	pst	
Gymnasium	100	psf	191	
Classrooms	40	psf		

(1) Plus partition loading (see Dead Loads) (2) Minimum load, or weight of equipment (t num load, or weight of equipment (the heavier)

1.3.2 Dead Loads:

3 1/2" Composite Floor	Syster	n 50	psf	
Flooring	6	psf	10.00	
Typical Ceilings		3	psf	
Ceilings Below Roof Tru	sses	6	psf	
Floor Collateral		8	psf	
Floor Framing		7	psf	
Floor Sprinklers		3	psf	
Partition Loading	20	psf		
Roof Collateral		5	psf	
Roof Insulation		5	psf	
Roof Sprinklers		3	psf	
Roofing System		6	psf	

(1) Collateral loads include: lighting, ductwork. Collateral loads include: lighting, ductwork, miscellaneous framing.
 Roofing system weight is the maximum unit weight of roofing materials and balast (where applicable) for which the roof structure is designed.
 Sprinkler loadings are for distribution lines and heads, exclusive of mains, which are included Separately as concentrated dead loads.
 Applied where noted under "Live Loads".

1.3.3 Wind Loads:

Base Mean Wind Velocity 115 mph Wind Exposure Classification B Wind Importance Factor 1.0

SECTION 2: FOUNDATIONS AND RELATED EARTHWORK GEOTECHNICAL REPORT

2.1 Design of foundations and structural components in contact with soil is based on the endations given in the following:

Report by TERRACON (Oklahoma City, OK) Date of Report May 29, 1998 Report Reference 03985191

LAPPED SPLICE LENGTHS

3 2.7 Lap reinforcing 30 bar diameters at splices unless noted or detailed otherwise CONCRETE COVER TO REINFORCING

3.2.8 Clearance from face of concrete to face of reinforcing:

Piers 3" Formed Grade Beams 1-1/2" top, 2" sides, 3" bottom Columns 1-1/2" interior, 2" exterior exposure Walls 1" interior, 2" exterior exposure Slabs 3/4"

Slabs 3/4" Beams 1-1/2" interior, 2" exterior exposure Basement Walls 1" inside face, 2" outside face 2. Refer to the geotechnical report for subsol conditions that may be encountered in the installation of foundations, and other information relevant to foundations and site preparation

2.3 Design of soil-supported building slabs is based on a range of soil movement of less than 1/2 inch, based on the recommendations of Geotechnical Report.

EARTH RETENTION SYSTEMS

2.5 The design of earth retention systems is not included in Structural Documents. Refer to the Technical Specifications for requirements.

STRAIGHT SHAFT PIERS

Bearing S	ratum:	Weathered Sillstone: 19 ft to 20 ft below grade
Top of Str	atum Elevation:	77 ft to 79 ft
(For Biddu	g Purposes Only)	
Allowable	End Bearing:	20,000 psf
Positive S	de Friction.	2,000 psf
Upheaval	Side Friction:	2,000 psf
Upheaval	Design Depth: 3 ft	into weathered siltstone
Negative S	ide Friction:	2,000 psf
Minimum I	enetration of Strata	a. 3 ft

2.7 Pier depths indicated are for bidding purposes only. Actual pier depths may vary depending on depth to bearing stratum

2.8 Steel dowels at tops of piers or footings shall extend 30 bar diameters above and below top of pier unless noted otherwise (noted as "LAP" on Typical Details).

2.9 Top of pier elevations given are relative to reference elevation 100'-0"

2.10 Over-pour at tops of piers ("mushrooms") shall be removed to the required pier diameter

BELLED PIERS

2.6

Bearing Stratum: Top of Stratum Elevation: Weathered Siltstone, 19 ft to 20 ft below grade 77 ft to 79 ft (For Bidding Purposes Only) Allowable End Bearing: 2,000 psf Minimum Penetration of Strata: 3 ft

2.7 Pier depths indicated are for bidding purposes only Actual pier depths may vary depending

on depth to bearing stratur

2.8 Steel dowels at tops of piers or footings shall extend 30 bar diameters above and below top of pier unless noted otherwise (noted as "LAP" on Typical Details).

2.9 Top of pier elevations given are relative to reference elevation 100'-0" 2.10 Over-pour at tops of piers ("mushrooms") shall be removed to the required pier diameter

SECTION 3: STRUCTURAL CONCRETE

3.0.4 Composite deck system shall be shored in accordance with manufacturer's requirements. Shoring is to remain in place until concrete has reached 75% of specified compressive streng In addition, shoring is to remain in place until all levels have been placed and have reached 75% of specified compressive strength.

3.0.5 At support points and edge of deck locations, composite deck shall be attached to load bearing walls and structural steel support beams with Hilt Flex Screws, Type 12-14x7/8 HWH #3, at 12° o.c. (JNO.

 $3\,0.6\,$ Deck shall span between supports. No midspan splicing of the deck is permitted. Provide # 10 tek screw side fasteners at 24" o.c.

SECTION 3.1 - CONCRETE FORMS

3.1.1 Formed Voids - Provide retained void spaces between bottom of structural members and sub grade as follows Grade Beams

6 inches 10 inches Structural Slabs 10 in Basement Walls 6 inches

3.1.2 Grade Beams - shall be formed both sides unless specifically shown or noted otherwise in the details

SECTION 32 - STEEL REINFORCING

STEEL REINFORCING 3.2.1 All bars shall be deformed in accordance with ASTM A615 Reinforcing indicated to be welded shall conform to ASTM A796.

3.2.2 Strength of bars shall be as follows All Bars Grade 60

SPLICING OF REINFORCING BARS

3.2.3 Top bars in beams, slabs or joists shall be spliced at midspan between supports, unless

3.2.4 Bottom bars in beams, slabs or joists shall be spliced at supports, unless noted otherwise

3.2.5 Vertical bars in walls shall be spliced at top of concrete above floors, unless noted

3.2.6 Column reinforcing shall be spliced at top of concrete above floors, unless noted otherwise

PLACEMENT OF REINFORCING 3.2.9 Offsets in reinforcing bars shall be bent at a ratio of 1 (normal to bar axis) to 6 (parallel to 3.2.10 Provide corner bars at intersections of beams and walls in accordance with Typical 3.2.11 Provide dowels from grade beams or foundation equal in size and spacing to vertical bars in walls or pilasters and extend one splice length above and below joint line, unless noted otherwise 3.2.12 Start stirrup spacing in beams 2 inches outside of face of supports. 3.2.13 Place first bar of slab reinforcing parallel to side 2 inches from a free edge or half of required bar spacing from face of edge beam. 3.2.14 Single layer reinforcing in walls shall be placed at center of walls unless noted 3.2.15 Place welded wire reinforcing in slabs in toppings, or in slabs poured on metal deck at center of slab unless noted otherwise. SECTION 3.3 - CONCRETE MIX DESIGNS 3.3.1 Concrete Mix Schedule: a) "HRC" refers to hardrock concrete having air dry unit weight of approximately 145 PCF b) "LWC" refers to sand lightweight concrete having dry unit weight not to exceed 120 PCF c) Where wir/ ratio is not indicated in the Concrete Mix Schedule, it shall be as necessary to meet strength requirer strength requirements. d) Where the wic ratio is shown, it shall be adhered to regardless of strength requirements. e) "Strength" is required compressive cylinder strength at an age of 28 days. Conc. Strength Agg. Agg. SlumpMax Class psi Type Size Inchesw/c Notes A 3000 HRC 1-1/2" 5-7 B 3000 HRC 1" 3-5 C 3500 HRC 1" 2-4 D 4500 HRC 1" 3-5 E 3000 HRC 3" 3-5 F 4000 HRC 1" 3-5 3-5 --3.3.2 Mix Usage Schedule: Concrete Air Description of Use Class Content 2.5-4% 5-6.5% 4.5-6% Drilled Piers Drited Piers A Footings A Grade Beams B Intenor Sila-bon-Grade C Basement Slab D Basement Walls D Retaining Walts D Elevator Pit Walls B Slab on Composite Metal Deck E Structural Beams and SlabD 4-5% 3.5-5% 2.5-4% 4.5-6% 5-6.5% 3.5-5% 5-6.5% 2.5-4%

4.5-6%

SECTION 3.4 - CONCRETE SLABS

3.4.1 Slabs Placed on Grade

Structural Columns D PCN Walls, Columns & Slabs F

Location Thickness Reinforcing

All 5 inches #3 @ 18 EW

a) Reinforcement shall be placed 2 inches from top of slab, unless detailed

rwise. b) Provide construction joints in slabs where indicated on Plans. Allow minimum of 4 days interval between placing adjacent sections of slab.

SECTION 5: STRUCTURAL STEEL

SECTION 5.1 - STRUCTURAL FRAME

5.1.1 Structural Steel Properties:

High Strength Steel ASTM A572 Grade 50 (Use High Strength Steel for W Shapes & Tees, uno) Angles, Channels, Plates, uno ASTM A53 Pipe Columns Experiments, Plates, and ASTM A53 Grade B Tooluir Columns ASTM A530, Grade B Tooluir Columns ASTM A500, Grade B High Strength Bolls ASTM A335 or A307 High Steel Astmosphere Back and ASTM A57M A57M ASTM ASTM A530 or A307 Anchor Bolts ASTM A320N High Strength Anchor BoltsASTM A193 Grade B7

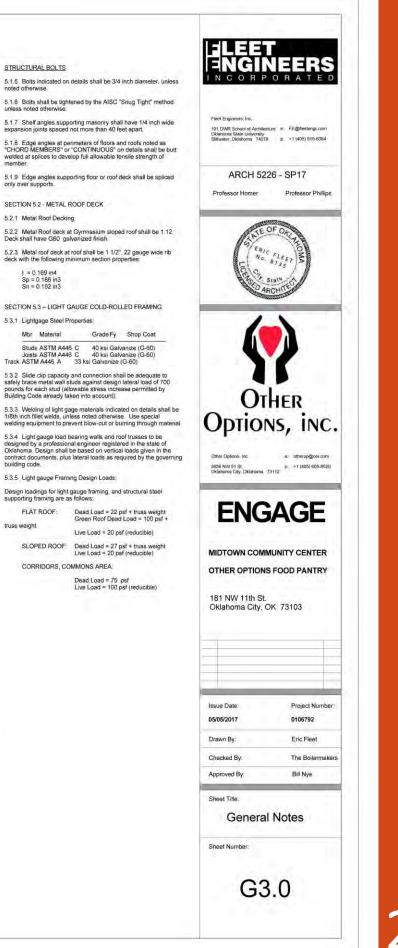

WELDING

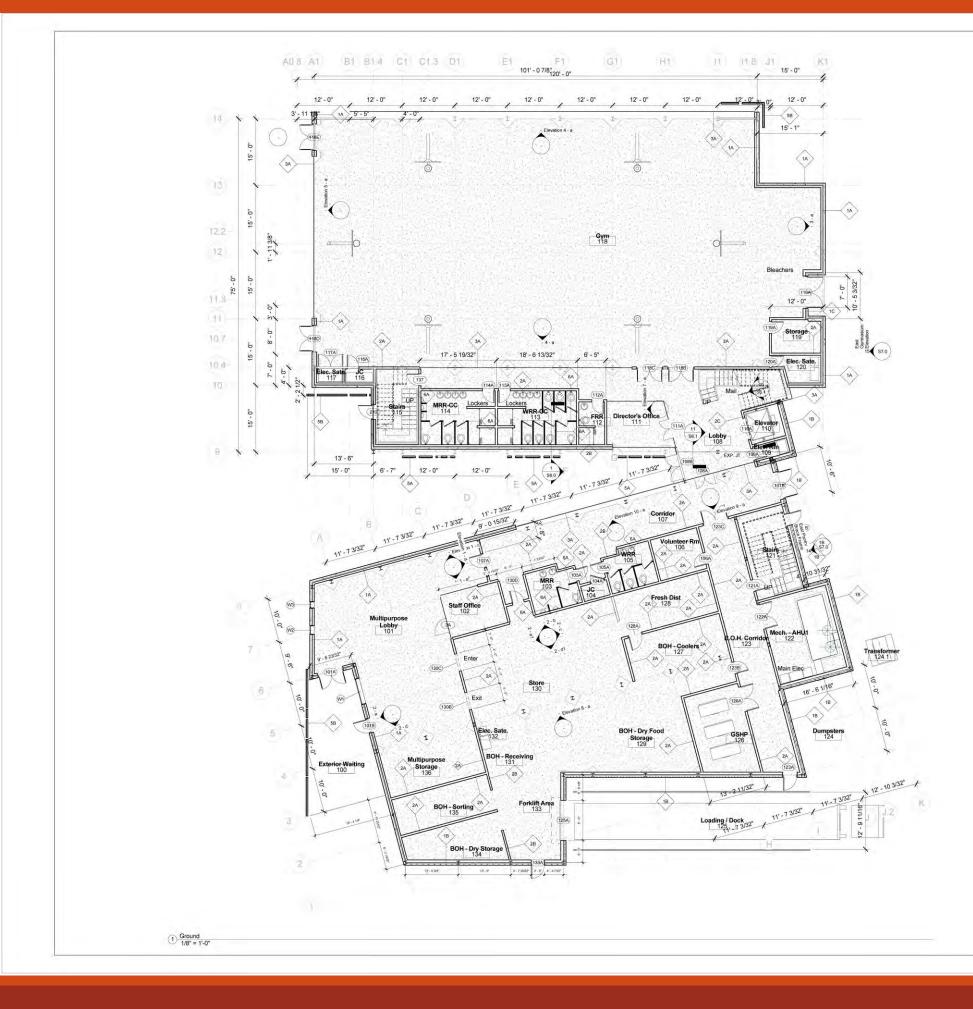

5.1.2 Unless otherwise noted, angles, plates, rods, and miscellaneous framing shall be welded at contact joints and supports. Weld sizes shall conform to AWS D1.1 minimums, except where noted otherwise.

 $5.1.3\,$ Where fillet weld sizes are not indicated on weld symbols, fillet size shall be 1/16th inch smaller than thickness of thinner of materials being joined.

5.1.4 Complete penetration welds are indicated by notation "CP" on weld symbols, partial
