## ACKNOW LEDGMENTS

The author wishes to express his gratitude to Dr. David L. Weeks for suggesting the present investigation and for his constant advice and suggestions while it was in progress.

The author is also deeply indebted to Dr. L. W ayne Johnson and Dr. Carl E. Marshall for offering financial assistance in the form of a graduate assistantship which enabled him to complete his graduate work.

The author is also indebted to Dr. Franklin A. Graybill who kindled his interest in the Design of Experiments and Experimental Designs during his one-year association with him at Oklahoma State University.

# CHAPTER I 

## INTRODUCTION

Components of variance has been discussed in many papers and analysis of variance components has become one of the basic tools of research in several fields of scientific investigation. In the problem of estimation, the researcher always tries to ascertain whether an estimator, best suited to the problem under consideration, possesses the well known properties of being unbiased, efficient, consistent, sufficient, minimum variance, etc. In practice, an objective of an investigation will be to strive to obtain minimum variance (best) unbiased estimators.

Any estimator, whether biased or unbiased minimum variance, must be a function of observations. It is known that sufficient statistics contain all the information in the sample about the parameters of a density function which describes a given population. It would be further desirable to ascertain whether a set of sufficient statistics can be reduced to a minimal set by employing the scheme given by Lehmann and Scheffe [8]. Moreover, the Rao-Blackwell theorem says that minimum variance unbiased estimates of the function of parameters must be based on a set of minimal sufficient statistics; but it does not enable us to determine which estimator is best if two or more unbiased estimators exist for the same function and each is based on a set of
minimal sufficient statistics. If the density function from which the minimal set was obtained has the property of being complete, the unbiased estimator of the function based on a set of minimal sufficient statistics is unique, and has minimum variance. Unfortunately* with regard to the problems under consideration in this thesis, the density functions are not complete when an Eisenhart Model II is assumed [4].
D. L. Weeks [9] has given a minimal set of sufficient statistics in case of BIB and GD-PBIB designs when there is no block treatment interaction. Unfortunately, in practice we do not always have such a nice situation.

Hence, the problem of this thesis is:
(i) To determine a minimal set of sufficient statistics for the parameters of the Balanced Incomplete Block Design when there is block-treatment interaction.
(ii) To find a minimal set of sufficient statistics for Group Divisible Partially Balanced Incomplete Block Designs with two associate classes when there is blockwtreatment interaction.
(iii) To find the distribution of each statistic in a minimal set of sufficient statistics for (i) and (ii).
(iv) To determine pairwise independence in each set.

## CHAPTER II

## NOTATIONS AND SYMBOLS

We shall introduce here the definitions of symbols which we shall use often in this thesis. They will be classified in three parts as follows:
(1) Abbreviations
(2) Scalars
(3) Matrices

## (1) Abbreviations

(a) BIB is an abbreviation for Balanced Incomplete Block.
(b) PBIB is an abbreviation for Partially Balanced Incomplete Block.
(c) GD-PBIB is an abbreviation for Group Divisible, Partially Balanced Incomplete Block Designs: If GD is prefixed by $S, S R$, or $R$, it will denote the Singular, Semi-Regular, or Regular Group Divisible, Partially Balanced Incomplete Block Design, respectively.
(d) E denotes Mathematical Expectation.
(e) MVN is an abbreviation for Multivariate Normal,
(f) $\mathrm{I}_{\text {denotes }}$ an operation on a density function which, when properly defined, reduces the dimension of the space of the sufficient statistics.
(g) $R[\mu, \beta, \tau,(\beta \tau)]=$ Reduction due to $\mu, \beta, \tau$, and $(\beta \tau)$.
(h) $R\left[\left(\beta_{T}\right) \mid \mu_{,} \beta_{0} T\right]=$ Reduction due to $\left(\beta_{T}\right)$ adjusted for $\mu_{\text {, }} \beta_{\%} \tau$.
(2) Scalars
(a) $b$ is equal to the number of bllocks in a design.
(b) $t$ is equal to the number of treatments in a design.
(c) $r$ is equal to the number of replicates of each treatment.
(d) $k$ is equal to the number of plots per block.
(e) $m$ denotes the number of times any treatment is replicated in any block, if it appears in that block.
(f) $\lambda$ denotes in a BIB, the number of times two different treatments occur together in all blocks.
(g) $\lambda_{i,}$, $(i=1,2)$, denotes in a PBIB, the number of times two different treatments which are i-th associates occur together in all blocks.
(h) $\lambda_{j}^{8}$ is the nonwcentrality parameter of the non-central chiw square distribution.
(i) g is the number of groups in a GD - PBIB Design.
(j) $n$ is the number of treatments per group in GD PBIB Designs.
(k) $v=k^{-1}\left(r k-x+\lambda_{1}\right)=k^{-1}\left[\lambda_{2} t+n\left(\lambda_{1}-\lambda_{2}\right)\right]$.
(3) Matrices
(a) X is a Design Matrix of a twoway classification model.
(b) $X_{1}$ is a partition of $X$ corresponding to blocks.
(c) $X_{2}$ is a partition of $X$ corresponding to treatments.
(d) $\mathrm{X}_{3}$ is a partition of X corresponding to interaction.
(e) $Y$ is a vector of observable random variables.
(f) $J_{q}^{s}$ is an $s: x$ q matrix of all one's. $j_{1}^{n}$ will be used to denote an $n \times 1$ vector of one's.
(g) $N=X_{2}^{\prime} X_{1}$
(h) $\quad \mathrm{M}=\mathrm{X}_{1}^{\prime} \mathrm{X}_{3}$
(i) $L=X_{2}^{1} X_{3}$
(j) $D$ is a diagonal matrix
(k) $P$ is an orthogonal matrix. When partitioning a matrix, partitions will be denoted by the addition of a subscript. Further partitions of a partition will be denoted by an additional subscript. Thus $P=$ $\left(P_{1}, P_{2}\right)=\left(P_{11}, P_{12}, P_{21}, P_{22}, P_{23}\right)$.
(1) $\nexists$ is a covariance matrix
(m) $\phi_{\mathrm{w}}$ represents a $\mathrm{w} \times \mathrm{w}$ matrix of all zeros.
(n) $A=\left[X_{2}-X_{1}\left(X_{1}^{\prime} X_{1}\right)^{-1} X_{1}^{\prime} X_{2}\right]$
(o) $\mathrm{I}_{\mathrm{w}}$ is the identity matrix of dimension $\mathrm{w} \times \mathrm{w}$.

Additional symbols if needed, will be defined as the discussion develops.

We shall now prove two lemmas which will be:needed for the proofs of the theorem in the ensuing chapters.

Lemma 1: Let $X$ denote the design matrix of two way classification model $Y=X \beta+e$ where the rank of $X$ is bk and where $X$ is of the form $X=\left(j_{1}^{b k m}, X_{1}, X_{2}, X_{3}\right)$. Then there exists a set of $b k(m-1)$ orthogonal rows $P$ such that $X_{1}^{P} P=\phi, X_{2}^{1}=\phi, X_{3}^{1} P=\phi$, and $J_{\text {bkm }}^{1}=\phi$.
Proof: Consider the matrix product

$$
X^{\prime}=\left(J_{1}^{b k m}, X_{1}, X_{2}, X_{3}\right)\left[\begin{array}{c}
J_{b k m}^{1} \\
X_{1}^{\prime} \\
X_{2}^{\prime} \\
X_{3}^{\prime}
\end{array}\right]=J_{b k m}^{b k m}+X_{1} X_{1}^{\prime}+X_{2} X_{2}^{\prime}+X_{3} X_{3}^{\prime}
$$

Since $X^{\prime}{ }^{\prime}$ is symmetric, there exists an orthogonal matrix $Q$ such that $Q^{\prime} X^{\prime} X^{\prime} Q=D$ where $D$ is a diagonal matrix. The number of nonzero elements on the diagonal of $D$ is bk since $X$ is of rank bk. Partition $Q$ into $Q=(C, P)$ where $C$ and $P$ are of dimensions $b k m \times b$ and bkm x bk(m-1) respectively, and such that

$$
Q^{\prime} X X^{\prime} Q=\left[\begin{array}{l}
C^{\prime} \\
P^{\prime}
\end{array}\right] \quad X^{\prime}[C, P]=\left[\begin{array}{ll}
D^{*} & \phi \\
\phi & \phi
\end{array}\right]
$$

where D is bk x bk. Therefore,

$$
P^{\prime} J_{b k m}^{b k m} P+P^{\prime} X_{1} X_{1}^{\prime} P+P^{\prime} X_{2} X_{2}^{\prime} P+P^{\prime} X_{3} X_{3}^{\prime} P=\phi
$$

The matrices $J_{b k m}^{b k m}, X_{1} X_{1}^{\prime}, X_{2} X_{2}^{\prime}$, and $X_{3} X_{3}^{\prime}$ are each positive semidefinite, each being the product of a matrix and its transpose. The matrices $P^{\prime} J_{b k m}^{b k m} P, P^{\prime} X_{1} X_{1}^{\prime} P, P^{\prime} X_{2} X_{2}^{1} P$, and $P^{\prime} X_{3} X_{3}^{\prime} P$ are also positive semi-definite for the same reason. Since each diagonal element of each of these matrices is the sum of squares of real numbers and the sum of these sum of squares is zero, the diagonal elements of each of the four afore mentioned matrices must be equal to zero. If any off diagonal element is non-zero, there would be at least one of the principal minors which would be negative, a contradiction of positive semi-definiteness. We therefore conclude that each of the matrices must be equal to the null matrix.

It is therefore obvious that

$$
J_{b k m}^{1} P=\phi, X_{i}^{\prime} P=\phi_{i}, \quad i=1,2,3 .
$$

Lemma 2: Let $N$ be a $t \times b$ matrix of rank $m$. Let $P$ be an orthogonal matrix such that $P^{\prime} N N^{\prime} P=D$ where $D$ is diagonal with characteristic roots of $\mathrm{NN}^{\prime}$ on the diagonal. If $\mathrm{s} \leqslant \mathrm{m}$ of the characteristic roots are equal to $d_{0}\left(d_{0} \neq 0\right)$, then the matrix $d_{0}^{-1 / 2} P_{0}^{1} N=C^{1}$ (say) is a set of $s$ orthogonal rows such that $C^{\prime} N^{1} N C=d_{0} I_{s}$ where $P_{0}$ is such that $P_{0}^{\prime} N^{\prime} P_{0}=d_{0} I_{s}$.

Proof: Since we are given that $s$ characteristic roots of $N N^{\prime}$ are equal we can partition $P$ into $\left(P_{0}, P_{1}\right)$ such that

$$
\left[\begin{array}{c}
P_{0}^{\prime}  \tag{1}\\
P_{1}^{\prime}
\end{array}\right] \quad N N^{1}\left(P_{0}, P_{1}\right)=D=\left[\begin{array}{ll}
d_{0} I_{s} & \phi \\
\phi & D_{1}
\end{array}\right]
$$

where $D_{1}$ is diagonal. Hence $P_{0}^{\prime} N N^{\prime} P_{0}=d_{0} I_{s}$, that is $\left(d_{0}^{-1 / 2} P_{0}^{1} N\right)\left(N^{\prime} P_{0}^{1} d_{0}^{-1 / 2}\right)$ $=I_{s}$. Consider now $\left(d_{0}^{-1 / 2} P_{0}^{1} N\right) N^{\prime} N\left(N^{\prime} P_{a_{0}} d_{0}^{-1 / 2}\right)=Z$ (say), then we may write $Z=\left(d_{0}^{-1 / 2} P_{0}^{i} N\right) N^{2}\left(P_{0} P_{0}^{1}+P_{1} P_{1}^{\prime}\right) N\left(N^{i} P_{0} d_{0}^{-1 / 2}\right)$. From (1) above, $P_{0}^{\prime}{ }^{N} N^{t} P_{1}=\phi$. Therefore,

$$
\begin{aligned}
Z & =d_{0}^{-1 / 2}\left(P_{0}^{\prime} N N^{\prime} P_{0}\right)\left(P_{0}^{1} N N^{\prime} P_{0}\right) d_{0}^{-1 / 2} \\
& =d_{0}^{-1 / 2}\left(d_{0} I_{s}\right)\left(d_{0} I_{s}\right) d_{0}^{-1 / 2} \\
& =d_{0}^{I} s
\end{aligned}
$$

Hence the lemma is proved.

## CHAPTER III

## THE BALANCED INCOMPLETE BLOCK

In this chapter we shall be concerned with finding a set of minimal sufficient statistics in a balanced incomplete block design when there is a component of variance corresponding to the block-treatment interaction and an Eisenhart Model II is assumed.

The Balanced Incomplete Block Design is defined as a design with the following properties:
(a) There are b blocks and t treatments.
(b) There are $k$ experimental units per block ( $k<t$ ).
(c) There is one and only one observation per cell.
(d) A treatment cannot appear more than once in a block.
(e) Each treatment is replicated exactly r times.
(f) The number of blocks in which a pair of treatments appear together is exactly $\lambda$.

We are going to discuss a case where there is block-treatment interaction and so we shall assume $m>1$ in order to obtain an estimate of the error variance. We shall, therefore, replace (c), (d), (e), and (f) by
 group of experimental units subjected to a particular block-treatment combination.
( $c^{1}$ ) There are exactly $m$ observations per cell.
(d') A treatment cannot appear more than once in the cells of the same block but it can appear $m$ times in the same cell as follows from ( $c^{\prime}$ ).
(e') Each treatment appears exactly $m$ times in each of $r$ different blocks.
( ${ }^{\prime}$ ) The number of blocks in which a pair of treatments appears together is exactly $\lambda$. This can also be worded as: the number of times a pair of treatments appears together in all blocks is $m \lambda$.

Specifically,

$$
\begin{equation*}
y_{i j k}=\mu+\beta_{i}+\tau_{j}+(\beta \tau)_{i, j}+e_{i j k} \tag{I}
\end{equation*}
$$

where $i=1,2, \ldots, b ; j=1,2, \ldots, t ; k=n_{i j}$,

$$
n_{i j}=\left\{\begin{array}{l}
0 \text { if treatment } j \text { does not appear in block } i . \\
1,2, \ldots, m, \text { if treatment } j \text { appears in block } i .
\end{array}\right.
$$

The observations $y_{i j 0}$ do not exist.
Under model II the following assumptions are made:
(1) $\beta_{i}, \tau_{j},(\beta T)_{i j}$ and $e_{i j k}$ are each distributed normally.
(2) $E\left(e_{i j k}\right)=0$ for all $i, j, k$.

$$
E\left(e_{i j k} e_{u v w}\right)=\left\{\begin{array}{l}
\sigma^{2} \text { if } i=u, j=v, k=w \\
0 \text { otherwise }
\end{array}\right.
$$

(3) $E\left(\beta_{i}\right)=0$ for all i.

$$
E\left(\beta_{i} \beta_{p}\right)=\left\{\begin{array}{l}
\sigma_{l}^{2} \text { if } i=p \\
0 \text { otherwise }
\end{array}\right.
$$

(4) $E\left(\tau_{j}\right)=0$ for all $j$.

$$
E\left(\tau_{j} \tau_{u}\right)=\left\{\begin{array}{l}
\sigma_{2}^{2} \text { if } j=u \\
0 \text { otherwise }
\end{array}\right.
$$

(5) $E(\tau \beta)_{i, j}=0$ for all $i$ and $j$.

$$
E\left[(\tau \beta)_{i j}(\tau \beta)_{u v}\right]=\left\{\begin{array}{l}
\sigma_{3}^{2} \text { if } i=u, j=v \\
0 \text { otherwise }
\end{array}\right.
$$

(6) $E\left(e_{i j k} \beta_{s}\right)=0$ for all $i$, $j$, $k$, and s.
(7) $E\left(e_{i, j k}{ }^{T} p\right)=0$ for all $i$, $j, k$, and $p$.
(8) $E\left[e_{i j k}(\beta \tau)_{u v}\right]=0$ for all $i$, $j$, k, and $u, v$.
(9) $E\left(\beta_{i} T_{j}\right)=0$ for all $i$, and $j$.
(10) $E\left[\beta_{i}(\beta \tau)_{u v}\right]=0$ for all i and $u$, $v$.
(11) $E\left[\tau_{j}(\beta \tau)_{u v}\right]=0$ for all $j$ and $u, v$.
(12) $\mu$ is constant.

The following relationships hold in BIB design when under the assump tions given above there is a block otreatment interaction.
(1) $\sum_{i} n_{i j}=m k$
(2) $\sum_{i} n_{i, j}=m r$
(3) $\quad \sum_{j} n_{i j} n_{i j t}=m^{2} \lambda\left(j \neq j^{\prime}\right)$
(4) $\quad b k=t x$
(5) $\quad \lambda(t-1)=x(k-1)$

The matrix model which fulfills the conditions set forth above can be written as

$$
\begin{equation*}
\mathrm{Y}=\mu \mathrm{J}_{\mathrm{l}}^{\mathrm{bkm}}+\mathrm{X}_{1} \beta+\mathrm{X}_{2} \tau+\mathrm{X}_{3}(\beta T)+e \tag{II}
\end{equation*}
$$

where $Y$ is the vector of bkm observations and we shall consider ellements ordered according to blocks, then treatments. $\mathrm{X}_{1}, \mathrm{X}_{2}$, and $\mathrm{X}_{3}$ are of
dimension bkm $\times \mathrm{b}$, bkm $\times \mathrm{t}$, and bkm x bk, respectively. $\beta, \tau,(\beta \tau)$, and $e$ are vectors of $b, t, b k$, and $b k m$ random variables respectively. The distributional properties can be written in c. matrix form as follows:
(1) e is distributed as the $\operatorname{MVN}\left(\phi, \sigma^{2} I_{b k m}\right)$.
(2) $\beta$ is distributed as the $\operatorname{MVN}\left(\phi, \sigma_{1}^{2} I_{b}\right)$.
(3) $\tau$ is distributed as the $\operatorname{MVN}\left(\phi, \sigma_{2}^{2} I_{t}\right)$ 。
(4) ( $\tau \beta$ ) is distributed as the $\operatorname{MVN}\left(\phi, \sigma_{3}^{2} I_{b k}\right)$.
(5) $E\left(e \beta^{\prime}\right)=\phi, E\left(\mathrm{e} \tau^{\prime}\right)=\phi, E\left[\mathrm{e}(\beta \tau)^{\prime}\right]=\phi ; E\left(\beta \tau^{\prime}\right)=0$, $E\left[\beta(\gamma \beta)^{i}\right]=\phi, E\left[\tau(\beta \tau)^{i}\right]=\phi$.

The following relationships hold for the matrices of the model.
(1) $X_{1}^{\prime} X_{1}=m I_{b}$
(2) $\mathrm{X}_{2}^{\prime} \mathrm{X}_{2}=\mathrm{mrI}_{\mathrm{t}}$
(3) $\mathrm{X}_{3}^{\prime} \mathrm{X}_{3}=\mathrm{mI}_{\mathrm{bk}}$
(4) $\mathrm{J}_{\mathrm{bkm}}^{\mathrm{bkm}} \mathrm{X}_{1}=\mathrm{mkJ} \mathrm{b}_{\mathrm{b}}^{\mathrm{bkm}}$
(5) $J_{b}^{b k m} X_{1}^{1}=J_{b k m}^{b k m}$
(6) $J_{b k m}^{b k m} X_{2}=r m J_{t}^{b k m}$
(7) $\mathrm{J}_{\mathrm{t}}^{\mathrm{bkm}} \mathrm{X}_{2}=\mathrm{J}$ bkm
(8) $J_{b k m}^{b k m} X_{3}=m J_{b k}^{b k m}$
(9) $J_{b k}^{b k m} X_{3}^{!}=J_{b k m}^{b k m}$
(10) If $X_{2}^{\prime} X_{1}=N, N N^{t}=m^{2}\left[(r-\lambda) I_{t}+\lambda J_{t}^{t}\right]$
(11) If $X_{3}^{1} X_{1}=M^{i}, M M^{1}=m^{2}{ }^{k_{b}}$
(12) If $X_{3}^{\prime} X_{2}=L^{\prime}, L L^{\prime}=m^{2}{ }_{r I}$
(13) $\left(X_{2}^{\prime}-m^{-1} k^{-1} N X_{1}^{1}\right) X_{2}=A^{\prime} X_{2}=\lambda k^{-1} m\left(t I_{t}-J_{t}^{t}\right)$
(14) $\left(\mathrm{X}_{2}^{\prime}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NX}_{1}^{\prime}\right) \mathrm{X}_{1}=\phi$
(15) $\mathrm{ML}^{\mathrm{t}}=\mathrm{mN}^{\mathrm{t}}$
(16) $\mathrm{MNL}^{4}=\mathrm{m}^{3}\left[(\mathrm{r}-\lambda) \mathrm{I}_{\mathrm{t}}+\lambda J_{\mathrm{t}}^{\mathrm{t}}\right]$
(17) $J_{t}^{t} N=m k J_{b}^{t}$
(18) $\mathrm{L}^{\prime} \mathrm{J}_{\mathrm{t}}^{\mathrm{t}} \mathrm{N}=\mathrm{m}^{2}{ }_{\mathrm{kJ}}^{b}{ }_{b}^{\mathrm{bk}}$
(19) $J_{t}^{t} \mathrm{~L}=m J_{b k}^{t}$
(20) $L \mathrm{JJ}_{\mathrm{t}}^{\mathrm{t}} \mathrm{NM}=\mathrm{m}^{3} \mathrm{~kJ}_{\mathrm{bk}}^{\mathrm{bk}}$
(21) $L^{\prime} J_{t}^{t} L=m^{2} J_{b k}^{b k}$
(22) $M^{i} N^{\prime} J_{t}^{t} L=m^{3} k J_{b k}^{b k}$
(23) $L^{\prime} J_{t}^{t}=m J_{t}^{b k}$
(24) $N \cdot J_{t}^{t} N=m^{2}{ }^{2} J_{b}^{b}$
(25) $N^{i J_{t}^{t}}=m k J_{t}^{b}$
(26) $M^{\prime} N^{\prime} J_{t}^{t}=m^{2}{ }_{k J}^{t}$
(27) $L^{1 J_{t}^{t}}=m^{-1} k^{-1} M^{\prime} N^{\prime} J_{t}^{t}$
(28) If $F^{t}=X_{3}^{t}-m^{-1} k^{-1} M^{\prime} X_{1}^{\prime}-m^{-1} \lambda^{-1} t^{-1} k\left(L^{\prime}-m^{-1} k^{-1} M^{\prime} N^{1}\right)$ $\left(X_{2}^{\prime}-m^{-1} k^{-1} N X_{1}^{\prime}\right)$, then $F^{\prime} J_{1}^{b k m}=0, F^{\prime} X_{1}=\phi, F^{\prime} X_{2}=\phi$ and $\mathrm{m}^{-1} \mathrm{~F}^{\mathrm{t}} \mathrm{F}$ is an idempotent matrix of rank $b k-b-t+1$.
(29) $X_{1} X_{1}^{\prime} X_{3} X_{3}^{\prime}=X_{3}^{\prime} X_{3}^{\prime} X_{1} X_{1}^{\prime}=m X_{1} X_{1}^{\prime}$
(30) $X_{2} X_{2}^{\prime} X_{3} X_{3}=X_{3} X_{3}^{\prime} X_{2} X_{2}^{t}=m X_{2} X_{2}^{1}$

We shall now define an operation, say $\ddagger$, which when operated on the joint distribution of the elements of the vector $Y$, gives a set of sufficient statistics which is minimal. This has been explained in the latter part of this chapter where we have discussed the minimal set of sufficient statistics.

The vector $Y$ is distributed as the multivariate normal with mean $\bar{\mu}$ and covariance matrix $\not \geqslant$ where

$$
\bar{\mu}=E(Y)=\mu J_{1}^{\mathrm{bkm}}
$$

and

$$
\not Z=E(Y-\bar{\mu})(Y-\bar{\mu})^{i}=\left(X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{i} \sigma_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}+\sigma^{2} I\right)
$$

The joint density of the elements of $Y$ is given by

$$
\begin{equation*}
\left.g(Y, \theta)=(2 \pi)^{-\frac{b k m}{2}} \right\rvert\, \not\left\langle\left.\nmid\right|^{-1 / 2} \exp \left[-2^{-1}(Y-\bar{\mu})^{\prime} \not \Psi^{-1}(Y-\bar{\mu})\right]\right. \tag{III}
\end{equation*}
$$

Consider now the operation $£ \mathrm{~g}(\mathrm{Y}, \theta)$ to be of the form

$$
\Xi g(Y, \theta)=(2 \pi)^{-\frac{b k m}{2}}|\bar{Z}|^{-1 / 2} \exp \left[-2^{-1}(Y-\bar{\mu})^{\prime} P P^{\prime} \mathbb{Z}^{-1} P P^{\prime}(Y-\bar{\mu})\right]
$$

where $P$ is an orthogonal bkm $x$ bkm matrix to be defined.

Let $P$ be partitioned as follows: $P=\left(R_{1}, R_{2}, R_{3}, R_{4}, R_{5}\right)$ where the dimensions of $R_{i}(i=1,2,3,4,5)$ are bkm $\times 1$, bkm $\times b-1$, bkm $\times t-1$, $b k m \times b k-b-t+1, b k m \times b k(m-1)$, respectively. We shall now define these five partitions of $P$ so that the condition of orthogonality is satisfied.

Let $R_{1}^{\prime}=(b \mathrm{~km})^{-1 / 2} \mathrm{~J}_{\mathrm{bkm}}^{1}$ and $\mathrm{R}_{5}$ be constructed in the same manner as the matrix $P$ of Lemma 1. We then have $R_{1}^{t} R_{1}=1$ and $R_{5}^{1} R_{5}=I_{b k(m-1)}$.

Consider now the matrix $N N^{\prime}=m^{2}\left[(r-\lambda) I_{t}+\lambda J_{t}^{t}\right]$. We can get the characteristic roots of $N N^{\prime}$ by solving the determinantal equation $\left|N N^{\prime}-\ell I\right|$ $=0$ for $\ell$. The characteristic roots of NN' are then $m^{2}(r-\lambda)$ and $m^{2}[r+$ $(t-1) \lambda]=m^{2} r k$ of multiplicities $(t-1)$ and 1 , respectively. Let $Q$ be an orthogonal matrix which diagonalizes $\mathrm{NN}^{\prime}$, that is

$$
Q^{\prime} N^{\prime} Q=\left[\begin{array}{lc}
m^{2} \mathrm{rk} & \phi \\
\phi & m^{2}(r-\lambda) I_{t-1}
\end{array}\right]
$$

Partition $Q$ into $\left(P_{1}, P_{3}\right)$ where $P_{1}$ and $P_{3}$ are of dimension $t \times 1$ and $t x(t-1)$, respectively. Then

$$
\left[\begin{array}{c}
P_{1}^{\prime} \\
P_{3}^{\prime}
\end{array}\right] N^{\prime}\left(P_{1}, P_{3}\right)=\left[\begin{array}{cc}
m^{2} r k & \phi \\
\phi & m^{2}(r-\lambda) I_{t-1}
\end{array}\right]=D_{1} \text { (say) }
$$

By Lemma 2 the orthogonal set of rows which diagonalizes $N^{\prime} N$ and gives the non-zero characteristic roots of $N^{\prime} N$ is $D_{1}^{-1 / 2} Q^{t} N$. Thus

$$
\left(D_{1}^{-1 / 2} Q^{\prime} N\right) N^{\prime} N\left(N^{\prime} Q D_{1}^{-1 / 2}\right)=D_{1}
$$

Since the rank of $N N^{\prime}$ is $t$, the rank of $N^{\prime} N$ is alsot. Since $N^{\prime} N$ is $b \times b$, there will be $b-t$ zero characteristic roots of $N^{\prime} N$. If by $P_{2}$
we denote the matrix which diagonalizes $N^{1} N$, we may write

$$
P_{2}^{i} N^{i} N P_{2}=\left[\begin{array}{llc}
m^{2} r k & \phi & \phi \\
\phi & \phi & \phi \\
\phi & \phi & m^{2}(r-\lambda) I_{t-1}
\end{array}\right]
$$

We can partition $P_{2}$ into $\left(P_{20}, P_{21}, P_{22}\right)$ and have

$$
P_{2}^{\prime} N^{\prime} N P_{2}=\left[\begin{array}{c}
P_{20}^{\prime} \\
P_{21}^{\prime} \\
P_{22}^{\prime}
\end{array}\right] N^{i} N\left(P_{20}, P_{21}, P_{22}\right)=\left[\begin{array}{llc}
m^{2} r k & \phi & \phi \\
\phi & \phi & \phi \\
\phi & \phi & m^{2}(r-\lambda) I_{t-1}
\end{array}\right]
$$

We can write $P_{22}^{i}=(r-\lambda)^{-1 / 2} m^{-1} P_{3}^{1} N$.
Since $A^{\prime}=\left(X_{2}^{1}-m^{-1} k^{-1} N X_{1}^{1}\right)$, the orthogonal matrix which diagonalizes $N^{\prime}{ }^{\prime}$ will also diagonalize $A^{\prime} \mathrm{A}$, for

$$
Q^{1}\left(\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{1}\right) Q=\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{D}_{1}
$$

where

$$
m r I=m^{-1} k^{-1} D_{1}=\left[\begin{array}{cc}
0 & \phi \\
\phi & m k^{-1} \lambda t I_{t-1}
\end{array}\right]
$$

Consider now $F^{1}=X_{3}^{1}-m^{-1} k^{-1} M^{\prime} X_{1}^{1}-m^{-1} \lambda^{-1} t^{-1} k\left(X_{3}^{1} A A^{\prime}\right)$. Since $m^{-1} F^{\prime} F=$ $m^{-1} F^{t} X_{3}$ is an idempotent matrix of rank $b k-b-t+1$, we can have $P_{4}^{\prime}$ as $b k-b-t+1 x b k$ orthogonal vectors from $b k x b k$ orthogonal matrix which would diagonalize $\mathrm{m}^{-1} \mathrm{~F}^{\boldsymbol{2}} \mathrm{F}$. This can be done since we can always choose $\mathrm{P}_{4}$ corresponding to non-zero characteristic roots of the idempotent matrix.

We now define the matrix $P$ of which we spoke when the operation
$\pm$ was discussed. Define $P$ in the following manner.

$$
P^{\prime}=\left[\begin{array}{l}
(\mathrm{bkm})^{-1 / 2} \mathrm{~J}_{\mathrm{bkm}}^{1} \\
(\mathrm{~km})^{-1} P_{21}^{\prime} X_{1}^{\prime} \\
(\mathrm{km})^{-1} P_{22}^{\prime} X_{1}^{\prime} \\
\left(\frac{k}{\lambda t \mathrm{~m}}\right)^{1 / 2} P_{3}^{1} A^{\prime} \\
m^{-1 / 2} P_{4}^{\prime} F^{\prime} \\
P_{5}^{\prime}
\end{array}\right]=\left[\begin{array}{l}
(\mathrm{bkm})^{-1 / 2} \mathrm{~J}_{\mathrm{bkm}}^{1} \\
(\mathrm{~km})^{-1 / 2_{P} P_{21}^{\prime} X_{1}^{\prime}} \\
{\left[\mathrm{km}^{3}(\mathrm{r}-\lambda)\right]^{-1 / 2} P_{3}^{1} N X_{1}^{\prime}} \\
{\left[\frac{k}{\lambda t m}\right]^{1 / 2} P_{3}^{\prime} A^{\prime}} \\
m^{-1 / 2} P_{4}^{\prime} F^{\prime} \\
P_{5}^{\prime}
\end{array}\right]
$$

where

$$
\begin{aligned}
& R_{2}^{\prime}=\left[\begin{array}{l}
(m k)^{-1 / 2} P_{21}^{\prime} X_{1}^{\prime} \\
(m k)^{-1 / 2} P_{22}^{\prime} X_{1}^{\prime}
\end{array}\right] \\
& R_{3}^{\prime}=\left(\frac{k}{\lambda t m}\right)^{1 / 2} P_{3}^{t} A^{\prime} \\
& R_{4}^{1}=m^{-1 / 2} P_{4}^{1} F^{\prime}
\end{aligned}
$$

and

$$
R_{5}^{\prime}=P_{5}^{\prime}
$$

It can be verified that $P$ is an orthogonal matrix. For proof, see Appendix I.

We shall first derive $P \nmid \not Z P$ and from Appendix II it follows that PrZP assumes the form as given in Table I.

In order to find $P{ }^{\prime} \Psi^{-1} P$ we shall make use of the fact that $\left(P^{\prime} \not P^{\prime}\right)^{-1}=$ $P^{\prime} \not Z^{-1} P$. We also note that if we have a matrix of the form

TABLE I

P' $\angle P$

$$
C=\left[\begin{array}{ll}
c_{1} I_{s} & c_{3} I_{s} \\
c_{3} I_{s} & c_{2} I_{s}
\end{array}\right]
$$

then

$$
C^{-1}=\left(c_{1} c_{2}-c_{3}^{2}\right)^{-1}\left[\begin{array}{cc}
c_{2} I_{s} & -c_{3} I_{s} \\
-c_{3} I_{s} & c_{1} I_{s}
\end{array}\right]
$$

With the help of this result $P^{\prime} \not Z^{-1} P$ is shown in Table II.
Let us examine the form $P^{1}(Y-\bar{\mu})$. We then have

$$
P^{\prime}(Y-\bar{\mu})=\left[\begin{array}{l}
(b k m)^{-1 / 2} J_{b k m}^{1}\left(Y-\mu J_{1}^{b k m}\right) \\
(m k)^{-1 / 2} P_{21}^{\prime} X_{1}^{\prime}\left(Y-\mu J_{1}^{b k m}\right) \\
(m k)^{-1 / 2} P_{22^{\prime}} X_{1}^{\prime}\left(Y-\mu J_{1}^{b k m}\right) \\
\left(\frac{k}{\lambda \operatorname{tm}}\right)^{1 / 2} P_{3}^{\prime} A^{\prime}\left(Y-\mu J_{1}^{b k m}\right) \\
m^{-1 / 2} P_{4}^{i} F^{\prime}\left(Y-\mu J_{1}^{b k m}\right) \\
P_{5}^{i}\left(Y-\mu J_{1}^{b k m}\right)
\end{array}\right]=\left[\begin{array}{l}
(b k m)^{1 / 2}(y \ldots-\mu) \\
(k m)^{-1 / 2} P_{21}^{\prime} X_{1}^{t} Y \\
(k m)^{-1 / 2} P_{2}^{\prime} X_{1}^{\prime} Y \\
\left(\frac{k}{\lambda t m}\right)^{1 / 2} P_{3}^{\prime} A^{\prime} Y \\
m^{-1 / 2} P_{4}^{\prime} F^{\prime} Y \\
P_{5}^{\prime} Y
\end{array}\right]
$$

where $y \ldots=(\mathrm{bkm})^{-1} \mathrm{~J}_{\mathrm{bkm}}^{1} \mathrm{Y}$.
Letting $q=(Y-\bar{\mu})^{\prime} P P^{\prime} Y^{-1} P P^{\prime}(Y-\vec{\mu})$, we have

$$
\begin{aligned}
\mathrm{q}= & \left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1}(\mathrm{bkm})(\mathrm{y} \ldots-\mu)^{2} \\
& +\left[k m\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)\right]^{-1} \mathrm{Y}^{t} X_{1} P_{21} P_{21}^{i} X_{1}^{i} Y \\
& +\left[k m d_{1}\right]^{-1}\left[\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{t} X_{1} P_{22^{\prime}} P_{22}^{1} X_{1}^{\prime} Y \\
& +\left[m \sigma_{3}^{2}+\sigma^{2}\right]^{-1} Y^{\prime} F P_{4} P_{4}^{i} F^{t} Y m^{-1}+\sigma^{-2} Y^{t} P_{5} P_{5}^{t} Y
\end{aligned}
$$

TABLE II

$$
\begin{aligned}
& P^{\prime} \not Z^{-1} P
\end{aligned}
$$

$$
\begin{aligned}
& d_{1}^{-1}=\sigma^{4}+m k \sigma^{2} \sigma_{1}^{2}+m r \sigma^{2} \sigma_{2}^{2}+2 m \sigma^{2} \sigma_{3}^{2}+m^{2} \lambda t \sigma_{1}^{2} \sigma_{2}^{2}+m^{2} k \sigma_{1}^{2} \sigma_{3}^{2}+m^{2}{ }_{r \sigma}{ }_{2}^{2} \sigma_{3}^{2}+m^{2} \dot{\sigma}_{3}^{4}
\end{aligned}
$$

$$
\begin{aligned}
& +\frac{k}{\lambda t m}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} Y^{\prime} A P_{3} P_{3}^{1} A^{\prime} Y \\
& -2 d_{1}^{-1}\left[m^{2} k^{-2}(r-\lambda)\right]^{1 / 2} Y^{\prime} X_{1} P_{22^{\prime}} P_{3}^{i} A^{\prime} Y \sigma_{2}^{2} .
\end{aligned}
$$

Define the seven statistics $s_{i}(i=1,2,3, . . .7)$ as follows:

$$
\begin{aligned}
& s_{1}=y \cdots \\
& s_{2}=(k m)^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \quad \text { not defined if } b=t \\
& s_{3}=(k m)^{-1} Y^{\prime} X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime Y} \\
& s_{4}=k^{-1}(r-\lambda)^{1 / 2} Y^{\prime} X_{1} P_{22} P_{3}^{\prime} A^{\prime} Y
\end{aligned}
$$

(IV)

$$
\begin{aligned}
& s_{5}=\frac{k}{\lambda t m} Y^{\prime} A P_{3} P_{3}^{\prime} A^{\prime} Y \\
& s_{6}=m^{-1} Y Y^{\prime} F P_{4} P_{4}^{1} F^{i} Y \\
& s_{7}=Y^{i} P_{5} P_{5}^{\prime} Y
\end{aligned}
$$

These seven statistics are sufficient for the parameters $\mu, \sigma^{2}, \sigma_{1}^{2}$, $\sigma_{2}^{2}, \sigma_{3}^{2}$. This follows from [7].

We shall now prove that this set of sufficient statistics is minimal for $g(Y, \theta)$. In order to prove this we shall make use of the scheme given by Lehmann and Scheffe [8]. This consists of defining a function $K\left(Y, Y_{0}\right)=\Varangle g(Y, \theta) / \Varangle g\left(Y_{0}, \theta\right)$ and finding the condition under which $K\left(Y, Y_{0}\right)$ is independent of parameters. We shall define $I$ to consist of operating on the exponent of $g(Y, \theta)$ with the matrix $P$ which we have already defined. A set of sufficient statistics is minimal sufficient when $K\left(Y, Y_{0}\right)$ being independent of parameters implies $s_{i}=s_{i 0}$ where the $s_{i}$ are a proposed set of minimal sufficient statistics and $\mathbf{s}_{\mathrm{i} 0}$ are obtained
from $\ddagger \mathrm{g}\left(Y_{0}, \theta\right)$ in the same manner as $s_{i}$ were obtained from $\bar{g}(Y, \theta)$. We can write $K\left(Y, Y_{0}\right)=\exp -2^{-1}\left(q-q_{0}\right)$ with $q$ defined above and $q_{0}$ the same as $q$ except $s_{i}(i=1, \ldots, 7)$ to be replaced by $s_{i 0},(i=1$, 2, . . . . 7).

Let us write $K\left(Y, Y_{0}\right)=\exp -2^{-1} \sum_{i=1}^{7} v_{i} u_{i}$ where $v_{i}(i=1, \cdots, 7)$ are defined below and $u_{i} \mp s_{i}-s_{i 0}(i=2, \ldots, 7)$ and $u_{1}=b k m\left(s_{1}-\mu\right)^{2}$ - bkm( $\left.s_{10}-\mu\right)^{2}$.
$g(Y, \theta)$ may be written in the form

$$
g(Y, \theta)=P(\theta) Q(Y) \exp \left[-\frac{1}{2} \sum_{i=1}^{k} v_{i}(\theta) u_{i}(Y)\right]
$$

A necessary and sufficient condition for the set of sufficient statistics $u_{i}(Y)$ to be minimal for $g(Y, \theta)$ is that there exist no non-zero constants $a_{1}, a_{2}, \ldots, a_{k}, c$ such that

$$
\begin{equation*}
\sum_{i=1}^{k} a_{i} v_{i}(\theta)=c \tag{V}
\end{equation*}
$$

Thus it is enough to prove that for the following eight functions,

$$
\begin{aligned}
& \mathrm{v}_{1}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} \\
& \mathrm{v}_{2}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)^{-1} \\
& \mathrm{v}_{3}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1}
\end{aligned}
$$

$$
v_{4}=\left[\sigma^{2}+\lambda k^{-1} m \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1}
$$

$$
\mathrm{v}_{5}=-2 \sigma_{2}^{2} \mathrm{~d}_{1}^{-1}
$$

$$
v_{6}=\left(\sigma^{2}+m \sigma_{3}^{2}\right)^{-1}
$$

$$
\begin{aligned}
& v_{7}=\sigma^{-2} \\
& v_{8}=v_{1} \mu
\end{aligned}
$$

(V) is not true for any $a_{1}, a_{2}, \cdots, a_{8}$ and $c$ except when all vanish.

In (VI) it is clear that $\mu$ appears only in $v_{8}$ since $v_{1}, v_{2}, \ldots, v_{7}$ are homogeneous functions of $\sigma, \sigma_{1}, \sigma_{2}$, and $\sigma_{3}$ of degrees -2 , the constant c can only be zero.

Effect the linear transformation:

$$
\begin{aligned}
& x=\sigma^{2} \\
& y=\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2} \\
& z=\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2} \\
& w=m \sigma_{3}^{2}+\sigma^{2}
\end{aligned}
$$

The functions in (6) become:

$$
\begin{aligned}
& v_{1}=x y w\left[z w+\frac{\lambda t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{2}=x z w\left[z w+\frac{\lambda t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{3}=x y z w\left[y-\frac{r-\lambda}{r k}(z-y)\right] D^{-1} \\
& v_{4}=x y z w\left[w+\frac{\lambda t}{r k}(z-y)\right] D^{-1} \\
& v_{5}=-2 x y z w\left[\frac{z-y}{m r}\right] D^{-1} \\
& v_{6}=x y z\left[z w+\frac{\lambda t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{7}=y z w\left[z w+\frac{\lambda t}{r k}(z-y)(y-w)\right] D^{-1}
\end{aligned}
$$

where $D=x y z w\left[z w+\frac{\lambda t}{r k}(z-y)(y-w)\right]$.
Observe that the term $x y^{2} w^{2}$ appears only in $v_{1}, ~ x z^{2} w^{2}$ appears only in $v_{2}, x y^{2} z^{2}$ appears only in $v_{6}$, and $y z^{2}{ }_{w}{ }^{2}$ appears only in $v_{7}$. This implies $v_{1}, v_{2}, v_{6}, v_{7}$ are mutually linearly independent of $v_{3}$, $v_{4}, v_{5}$. Now observe that after removing the common factor xyzw in $\mathrm{v}_{3}, \mathrm{v}_{4}$, and $\mathrm{v}_{5}$, these are also linearly independent, thereby proving that $(V)$ is not true unless $a_{1}, a_{2}, \cdots, a_{7}$ and $c$ vanish. This condition then implies the set of sufficient statistics defined in (IV) is minimal.

Summarizing the results of this chapter will be accomplished by means of the following theorems and corollaries.

Theorem 1: If an Eisenhart Model II is assumed in a balanced incom-
plete block design with interaction, then there are seven statistics
in a minimal set of sufficient statistics if $b>t$ and there are six
statistics in a minimal set if $\mathrm{b}=\mathrm{t}$.
Corpllary 1.1. The explicit form of the statistics in a minimal set
are as follows:

1. $s_{1}=y \ldots$
2. $s_{2}=(k m)^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \quad$ if $b>t$, not defined if $b=t$.
3. $s_{3}=(k m)^{-1} \mathrm{Y}^{\mathrm{I}} \mathrm{X}_{1} \mathrm{P}_{22}{ }^{\mathrm{P}}{ }_{22}^{\mathrm{t}} \mathrm{X}_{1}^{\mathrm{t}} \mathrm{Y}$
4. $s_{4}=k^{-1}(r-\lambda)^{1 / 2} Y^{\prime} X_{1} P_{22} P_{3}^{!} A^{\prime} Y$
5. $s_{5}=\frac{k}{\lambda t m} Y^{\prime} A P_{3} P_{3}^{\prime} A^{t} Y$
6. $s_{6}=m^{-1} Y^{1} F P_{4} P_{4}^{1} F^{t} Y$
7. $S_{7}=Y^{t} P_{5} P_{5}^{1} Y$
where $P_{21}^{t} N^{t} N P_{21}=\phi_{b-t^{\prime}}, P_{3}^{\prime} N N^{\prime} P_{3}=m^{2}(x-\lambda) I_{t-1}, m^{-1} P_{4}^{t} F^{t} F P_{4}=$ $I_{b k-b-t+1}$.

Corollary 1.2. The expectations of each of the statistics as defined
in Corollary 1.1 are as follows:

1. $E\left(s_{1}\right)=\mu$
2. $E\left(s_{2}\right)=(b-t)\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)$
3. $\mathrm{E}\left(\mathrm{s}_{3}\right)=(\mathrm{t}-1)\left[\sigma^{2}+m \mathrm{k} \sigma_{1}^{2}+m \mathrm{k}^{-1}(r-\lambda) \sigma_{2}^{2}+\mathrm{m} \sigma_{3}^{2}\right]$
4. $E\left(s_{4}\right)=(t-1) k^{-2} m^{2}(r-\lambda) \lambda t \sigma_{2}^{2}$
5. $E\left(s_{5}\right)=(t-1)\left(\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right)$
6. $E\left(s_{6}\right)=(b k-b-t+1)\left(\sigma^{2}+m \sigma_{3}^{2}\right)$
7. $E\left(s_{7}\right)=b k(m-1) \sigma^{2}$

For the proof of the corollary see Appendix III.
Corollary 1.3. The distribution of each of the statistics of the minimal

## set as defined in Corollary 1.1 is as follows:

1. $s_{1} \sim N\left[\mu,(b k m)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]$
2. $s_{2} \sim\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) X_{b-t}^{2}$ if $b>t$; not defined if $b=t$,
3. $s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] X_{t-1}^{2}$
4. $s_{5} \sim\left[\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] x_{t-1}^{2}$
5. $s_{6} \sim\left[\sigma^{2}+m \sigma_{3}^{2}\right] x_{b k-b-t+1}^{2}$
6. $\quad s_{7} \sim \sigma^{2} X_{b k(m-1)}^{2}$
7. $s_{4}$ is distributed as a linear combination of independent chi-square variables that is $s_{4} \sim \Sigma_{p_{i}} X_{(1)}^{2}$ where $p_{i}$ are the non-zero characteristic roots of $2^{-1}\left(A_{4}+A_{4}^{1}\right) \nVdash$ where $A_{4}=k^{-1} m^{-1} X_{1} N^{\prime} P_{3} P_{3}^{1} A^{t}$.

The proof of this corollary appears in Appendix III.
Corollary 1.4. The statistics $s_{i}(i=1,2, \ldots, 7)$, are pairwise
independent except for pairs $\left(s_{3}, s_{4}\right),\left(s_{3}, s_{5}\right)$, and $\left(s_{4}, s_{5}\right)$.
The proof of this corollary is given in Appendix V.
Corollary 1.5. The seven statistics as defined in Corollary 1.1 may
be computed from the following Analysis of Variance Table
(Table III).
See Appendix V for proof.

## Table III

Analysis of Variance, Balanced Incomplete Block

| Source | Statistic |
| :---: | :---: |
| Mean | $b k m y{ }^{2} .=b_{k m s}^{2}$ |
| Blocks (ignoring treatments) | $(\mathrm{mk})^{-1} \Sigma\left(\mathrm{~B}_{\mathrm{i}}-\mathrm{B} .\right)^{2}$ |
| Block-treatment-interactionerror component | $\left[\mathrm{km}^{3}(\mathrm{r}-\lambda)\right]^{-1} \Sigma\left(\mathrm{~T}_{\mathrm{j}}-\mathrm{T} \cdot\right)^{2}=\mathrm{s}_{3}$ |
| Block-interaction-error :..... component | By subtraction ( $s_{2}$ ) |
| Treatment-interaction Error Component | $\left(\frac{k}{\lambda t m}\right) \Sigma Q_{j}^{2}=s_{5}$ |
| Interaction-Error Component | $m^{-1}\left(\sum_{n=l}^{b k} c_{i}^{2}-k^{-1} \sum_{i=1}^{b} B_{i}^{2}-\frac{k}{\lambda t} \Sigma Q_{j}^{2}\right)$ |
| Intra-block Error with $s_{4}=m^{-1} k^{\sim 1} \Sigma T_{j} Q_{j}$ | By subtraction ( $s_{7}$ ) |

The notation used here is explained in Appendices III and $V$.

## CHAPTER IV

## GROUP DIVISIBLE, PARTIALLY BALANCED INCOMPLETE BLOCK DESIGNS (WITH TWO ASSOCIATE CLASSES)

In this chapter we shall be interested in finding sets of minimal suf. ficient statistics for each of the three types of group divisible designs when there is a component of variance corresponding to the block-treatment interaction and an Eisenhart Model II is assumed.

Definitions:
An incomplete block design is said to be partially balanced with two associate classes if:
(1) there are b blocks and each with $k$ experimental units.
(2) there are $t>k$ treatments, each of which satisfies the following:
(a) A treatment cannot appear more than once in a block;
(b) Each treatment appears exactiy $s$ times in all blocks:
(c) Each treatment has exactly $n_{i}$ i-th associates;
(d) Two treatments which are i-th associates occur togetiew
in exactly $\lambda_{i}$ blocks;
(3) any pair of treatments satisfy the following:
(a) The pair are either first or second associates:
(b) Any pair of treatments which are i-th associates, the mumber of treatments common to the $j$-th associate of the first and the k-th associate of the second is $p_{j k}^{j}$ and is independent of the pair of treatments.

From the above definitions, the following relationships hold:
(i) $\quad \mathrm{bk}=\mathrm{rt}$
(ii) $n_{1}+n_{z}=t-1$
(iii) $n_{1} \lambda_{1}+n_{2} \lambda_{2}=r k-r$.

A group divisible, partially balanced incomplete block design is defined as a design in which the treatments are arranged such that there are $g$ groups of $n$ treatments each, such that any two treatments of the same group occur in exactly $\lambda_{1}$ blocks, and any two treatments which are in different groups occur together in exactly $\lambda_{2}$ blocks.

For the group divisible designs, the following relationships hold:
(i) $t=g n$
(ii) $n_{1}=n-1$
(iii) $n_{2}=n(g-1)$
(iv) $r \geqslant \lambda_{1}$
(v) $r k-\lambda_{2} t \geqslant 0$
(vi) $(n-1) \lambda_{1}+n(g-1) \lambda_{2}=r(k-1)$

They are classified into three types by Bose, Clatworthy, and Shrikhande [2] as follows:
(i) Singular if $\mathbf{r}=\lambda_{1}$
(ii) Semi-Regular if $r k-\lambda_{2} t=0$
(iii) Regular if $r>\lambda_{1}$ and $r k-\lambda_{2} t>0$.

We are going to discuss a case where there is block-treatment interaction and we shall assume we have more than one observation per cell. We shall therefore replace (2) in the definition of an incomplete block design by (2') as follows where a cell is a group of experimental units subjected to a particular block-treatment combination.
(a) There are exactly mobservations per cell;
(b) A treatment cannot appear more than once in different cells in the same block but appears $m$ times in the same cell as follows from (a).
(c) Each treatment appears exactly $m$ times in each of $r$ different blocks.
(d) Each treatment has exactly $n_{i}$ i-th as sociates.
(e) The number of times a pair of treatments which are i-th associates appear together in all blocks is $m \lambda_{i}$.

In spite of the above change, all the relationships (i) to (vi) given above are true.

We shall now discuss some of the general properties of all three types of designs before we find a set of minimal sufficient statistics for each.

We shall assume here the same model as in the BIB design with the same distributional properties of the random variables. The matrix model will be:

$$
\begin{equation*}
\mathrm{Y}=\mu J_{1}^{\mathrm{bkm}}+\mathrm{X}_{1} \beta+\mathrm{X}_{2} \tau+\mathrm{X}_{3}(\beta \tau)+\mathrm{e} \tag{I}
\end{equation*}
$$

where $Y$ is distributed as the multivariate normal, mean $\bar{\mu}=\mu \mathrm{J}_{1}^{\mathrm{bkm}}$ and covariance matrix

$$
\mathbb{Z}=\mathrm{X}_{1} \mathrm{X}_{1}^{1} \sigma_{1}^{2}+\mathrm{X}_{2} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{1} \sigma_{3}^{2}+\sigma^{2} \mathrm{I}
$$

All the results (1) to (30) which are true for the BIB Designs will hold here except (10), (13), (16), and (28). We shall replace (10), (13), (16), and (28) by (10), (13), (16 ), and (28), respectively.
(10)

$$
N N^{\prime}=m^{2}\left[r B_{0}+\lambda_{1} B_{1}+\lambda_{2} B_{2}\right] \text { where } B_{t}=n_{i a}^{t},(t=0,1,2)
$$ $B_{t}$ is a $t \times t$ symmetric matrix, $n_{i a}^{t}=\left\{\begin{array}{l}1 \text { if the i-th and } a-\text { th treatments are } t \text { associates } \\ 0 \text { otherwise }\end{array}\right.$ $\mathrm{i}, \mathrm{a}=1,2, \ldots, \mathrm{t} ; \mathrm{t}=0,1,2$. If $\mathrm{t}=0, \mathrm{~B}_{0}=\mathrm{I}_{\mathrm{t}}$. Moreover, $B_{0}+B_{1}+B_{2}=J_{t}^{t}$.

$$
\begin{align*}
\left(X_{2}^{\prime}-m^{-1} k^{-1} N X_{1}\right) X_{2} & =\left(m r I_{t}-m^{-1} k^{-1} N N^{\prime}\right)  \tag{13'}\\
& =\left[m r I_{t}-m k^{-1}\left(r B_{0}+\lambda_{1} B_{1}+\lambda_{2} B_{2}\right)\right] \\
& =\frac{m}{k}\left[r(k-1) B_{0}-\lambda_{1} B_{1}-\lambda_{2} B_{2}\right]
\end{align*}
$$

$$
\begin{align*}
& \quad B_{t} B_{s}=\sum_{\ell=0}^{2} p_{s t}^{\ell} B_{\ell}, \text { where } \mathrm{p}_{s t}^{\ell} \text { is as defined previously with }  \tag{16}\\
& \mathrm{p}_{\mathrm{st}}^{0}= \begin{cases}0 & \text { if } \mathrm{s} \neq \mathrm{t} \\
\mathrm{n}_{\mathrm{s}}= & \mathrm{n}_{\mathrm{t}} \text { if } \mathrm{s}=\mathrm{t}\end{cases}
\end{align*}
$$

In defining $\mathrm{p}_{\mathrm{st}}^{0}$ we are making use of the convention that a treatment will be considered its own 0 -th associate.
$\left(28^{\prime}\right)$
If
$F^{\prime}=X_{3}^{\prime}-m^{-1} k^{-1} M^{\prime} X_{1}^{\prime}-\frac{k}{\left(r k-r+\lambda_{1}\right) m^{\prime}}\left(X_{3}^{\prime} A A A^{\prime}\right)-\frac{k\left(\lambda_{1}-\lambda_{2}\right)}{\lambda_{2}\left(r k-r+\lambda_{1}\right) m}\left[X_{3}^{\prime} A\right]\left[B_{0}+B_{1}\right] A^{\prime}$
then $F^{\prime} J_{1}^{b k m}=\phi, F^{\prime} X_{1}=\phi, F^{\prime} X_{2}=\phi$, and $m^{-1} F^{\prime} F$ is an idempotent matrix of rank bk-b-t+l.

The joint density of the elements of Y is given by

$$
g(Y, \theta)=(2 \pi)^{-\frac{b k m}{2}}|\overline{4}|^{-1 / 2} \exp \left[-2^{-1}(Y-\bar{\mu}) \cdot \Psi^{-1}(Y-\bar{\mu})\right]
$$

Before we define the operation $\ddagger$ on $g(Y, \theta)$, it may be stated here that the elements of the vector $Y$ can be ordered in such a way that the matrix $\mathrm{NN}^{\prime}$ assumes the form as given by ( $10^{\prime}$ ) and hence we can find the characteristic roots of $\mathrm{NN}^{\text {' [ }}$ [1] and they are shown in Table IV.

Table IV
Characteristic Roots of NN ${ }^{\text {' }}$ in GD-PBIB Designs

Multiplicities
1
g-1
$g(n-1)$

$$
\begin{gathered}
\text { Roots } \\
\mathrm{m}^{2} \mathrm{rk} \\
\mathrm{~m}^{2}\left(\mathrm{rk}-\lambda_{2} \mathrm{t}\right) \\
\mathrm{m}^{2}\left(r-\lambda_{1}\right)
\end{gathered}
$$

Imposing the restrictions on the roots for each of the three types of designs we have the results as given in Table V.

## Table V

Characteristic Roots of NN' for S, SR and R-GD-PBIB Designs

Multiplicities

1
g -1
$g(n-1)$

Roots Roots
Roots

$$
m^{2} r k
$$

$m^{2} r k$
$m^{2}\left(r k-\lambda_{2} t\right)$
$m^{2}\left(x-\lambda_{1}\right)$

Since NN' $^{\prime}$ is symmetric there exists an orthogonal matrix $Q_{3}$ such that $Q_{3}^{\prime} N^{\prime} Q_{3}=D_{3}$ where $D_{3}$ is diagonal with the characteristic roots of $\mathrm{NN}^{1}$ displayed on the main diagonal. Partition $Q_{3}$ into ( $\mathrm{P}_{30}, P_{31}, P_{32}$ ) where $P_{30}, P_{31}$, and $P_{32}$ are of dimension $t \times 1, t x(g-1)$, and $t x g(n-1)$ respectively. We then have,

Since the nonmerp characteristic roots of $N$ ' $N$ are equal to the non-zero characteristic of $\mathrm{NN}^{1}$ and ar e of the same multiplicity, there exists an orthogonal matrix $Q_{2}$ such that

$$
Q_{2}^{\prime} N^{\prime} \mathrm{NQ}_{2}=\left[\begin{array}{lcr}
\mathrm{m}^{2} \mathrm{rk} & \phi & \phi \\
\phi & \phi_{\mathrm{C}_{0}}+\mathrm{c}_{1}^{\prime} & \phi \\
\phi & \phi & \mathrm{D}_{3}^{*}
\end{array}\right]
$$

where
$c_{0}=$ multiplicity of zero characteristic roots of $\mathrm{NN}^{\prime}$
$c_{1}^{\prime}=b-t$
$D_{3}^{*}=$ Diagonal matrix of the non-zero characteristic roots of $N^{1}$ excluding the root $\mathrm{m}^{2} \mathrm{rk}$.

Partition $Q_{2}$ into ( $\left.P_{20}, P_{21}, Q_{22}\right)$ where the dimensions of $P_{20}, P_{21}$, and $Q_{22}$ are $b \times 1, b \times c_{0}+c_{1}^{1}$, and $\mathrm{b} \times \underset{i=1}{\mathbb{E}} \mathrm{c}_{\mathrm{i}}$, respectively, where $\mathrm{c}_{\mathrm{i}}$
denotes the multiplicity of the i-th non-zero characteristic roots of NN! other than $\mathrm{m}^{2} \mathrm{rk}$. We may write,

$$
\left[\begin{array}{c}
P_{20}^{\prime} \\
P_{21}^{\prime} \\
Q_{22}
\end{array}\right] N^{\prime} N\left(P_{20}, P_{21}, Q_{22}\right)=\left[\begin{array}{ccr}
r k & \phi & \phi \\
\phi & \phi_{c_{0}+c_{1}^{\prime}} & \phi \\
\phi & \phi & D_{3}^{*}
\end{array}\right]
$$

Then for,
(i) S-GD-PBIB designs $Q_{22}^{t}=P_{22}^{\prime}$ will be of dimension ( $g-1$ ) $\times b$;
(ii) SR-GD-PBIB designs $Q_{22}^{\prime}=P_{23}^{\prime}$ will be of dimension $g(n-1) \times b ;$
(iii) R-GD-PBIB designs $Q_{22}=\left(P_{22}, P_{23}\right)$.

Now we shall exhibit the relations among the partitions of $Q_{3}$ and $Q_{2}$ as given in Lemma 2. Then for
(i) S-GD-PBIB designs $P_{22}^{\prime}=\left[m^{2}\left(r k-\lambda_{2} t\right)\right]^{-1 / 2} P_{31}^{\mathrm{t}} N$.
(ii) $S R-G D-P B I B$ designs $P_{23}^{\prime}=\left[m^{2}\left(r-\lambda_{1}\right)\right]^{-1 / 2} P_{32}^{\prime} N$.
(iii) R-GD-PBIB designs, the above two realtionships hold.

We shall now consider the matrix $A^{\prime} A$. The orthogonal matrix which diagonalizes $\mathrm{NN}^{\mathrm{t}}$ also diagonalizes $\mathrm{A}^{\mathrm{t}} \mathrm{A}$ for

$$
\begin{aligned}
Q_{3}^{\prime} A^{\prime} A Q_{3} & =Q_{3}^{\prime}\left[X_{2}^{\prime}-m^{-1} k^{-1} N X_{1}^{\prime}\right]\left[X_{2}-m^{-1} k^{-1} X_{1} N^{\prime}\right] Q_{3} \\
& =Q_{3}^{1}\left[r m I-m^{-1} k^{-1} N N^{\prime}\right] Q_{3} \\
& =m r I-m^{-1} k^{-1} D_{3}
\end{aligned}
$$

The characteristic roots of $A^{\prime} \mathrm{A}$ are then as given in Table VI.

Table VI
Characteristic Roots of $A^{2} A$ for GD-PBIB Designs

Multiplicities

$$
\begin{gathered}
1 \\
g-1 \\
g(n-1)
\end{gathered}
$$

Roots
0
$m k^{-1} \lambda_{2} t$
$m k^{-1}\left[\lambda_{2}^{t}+n\left(\lambda_{1}-\lambda_{2}\right)\right]$

By making use of restrictions for each of the three types of GD-PBIB designs we have the characteristic roots of $A^{\prime} A$ in Table VII.

Table VII
Characteristic Roots of $A^{\prime} A$ for $S, S R$, and R-GD-PBIB Designs

| Multiplicities | Roots (S) | Roots (SR) | Roots (R) |
| :---: | :---: | :---: | :---: |
| 1 | 0 | 0 | 0 |
| $g-1$ | $\mathrm{mk}^{-1} \lambda_{2} \mathrm{t}$ | mr | $\mathrm{mk}^{-1} \lambda_{2} \mathrm{t}$ |
| $\mathrm{g}(\mathrm{n}-1)$ | mr | mv | mv |

Consider now a bkm $\times \mathrm{bkm}$ orthogonal matrix $P^{\prime}$ defined in the following way:

$$
P^{\prime}=\left[\begin{array}{l}
R_{1}^{\prime} \\
R_{2}^{\prime} \\
G_{3} R_{3}^{\prime} \\
R_{4}^{\prime} \\
P_{5}^{\prime}
\end{array}\right]
$$

where $R_{1}, R_{2}, R_{3}$, and $R_{4}$ are defined as follows and $P_{5}^{\prime}$ be constructed in the same manner as the matrix $P$ of Lemma 1.

$$
\mathrm{R}_{1}^{1}=(\mathrm{bkm})^{-1 / 2} \mathrm{~J}_{\mathrm{bkm}}^{1}
$$

$$
R_{2}^{\prime}=\left\{\begin{array}{l}
{\left[\begin{array}{l}
(m \mathrm{k})^{-1 / 2} P_{21}^{\prime} X_{1}^{\prime} \\
(m \mathrm{~m})^{-1 / 2} P_{22^{\prime}}^{\prime} X_{1}^{\prime}
\end{array}\right]} \\
{\left[(\mathrm{mk})^{-1 / 2} \mathrm{P}_{21}^{\prime} X_{1}^{\prime}\right.} \\
(\mathrm{mk})^{-1 / 2} \mathrm{P}_{23}^{\prime} X_{1}^{\prime}
\end{array}\right]
$$

for S-GD-PBIB Designs
for SR-GD-PBIB Designs
for R-GD-PBIB Designs
for S-GD-PBIB Designs
for $\operatorname{SR}$-GD-PBIB Designs
for R-GD-PBIB Designs
$R_{4}^{t}=m^{-1 / 2} P_{4}^{t} F^{t}$ where $F^{r}$ is as given in $\left(28^{I}\right)$ and $P_{4}^{1}$ is a set of $b k-b-t+1 \times b k$ orthogonal vectors from a bk $x$ bk orthogonal matrix which diagonalizes $\mathrm{m}^{-1} \mathrm{~F}^{\prime} \mathrm{F}$. Consider the operation $\Psi(Y, \theta)$ to be

$$
\begin{equation*}
\left. \pm g(Y, \theta)=(2 \pi)^{-\frac{b k m}{2}} \right\rvert\, \nmid^{-1 / 2} \exp \left[-2^{-1}(Y-\bar{\mu})^{i} P P^{\prime} \Psi^{-1} P P(Y-\bar{\mu})\right] \tag{II}
\end{equation*}
$$

where $P$ is an orthogonal matrix defined above.
We shall now consider each of the three type of group divisible designs separately using the results we have derived so far in general.

Singular Group Divisible Partially Balanced Incomplete Block Designs.
In Appendix II P'YP is shown to be of the form as given in Table VIII.

## Table VIII

$$
\begin{aligned}
& {\left[\begin{array}{ccccccc}
\mathrm{U}_{11} & \phi & \phi & \phi & \phi & \phi & \phi \\
\phi & \mathrm{U}_{22} & \phi & \phi & \phi & \phi & \phi \\
\phi & \phi & \mathrm{U}_{33} & \mathrm{U}_{34} & \phi & \phi & \phi \\
\phi & \phi & \mathrm{U}_{43} & \mathrm{U}_{44} & \phi & \phi & \phi \\
\phi & \phi & \phi & \phi & \mathrm{U}_{55} & \phi & \phi \\
\phi & \phi & \phi & \phi & \phi & U_{66} & \phi \\
\phi & \phi & \phi & \phi & \phi & \phi & U_{77}
\end{array}\right]} \\
& U_{11}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{2}^{2}+m \sigma_{3}^{2}\right) \\
& U_{22}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) I_{c}+c_{1}^{1} \\
& U_{33}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2}^{\left.t) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] I_{g-1}}\right.\right.
\end{aligned}
$$

$$
\begin{aligned}
& U_{34}=U_{43}=m k^{-1}\left(r k-\lambda_{2}^{t}\right)^{1 / 2}\left(\lambda_{2} t\right)^{1 / 2} \sigma_{2}^{2} I_{g-1} \\
& U_{44}=\left[m k^{-1} \lambda_{2} \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] I_{g-1} \\
& U_{55}=\left(m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right) I_{g(n-1)} \\
& U_{66}=\left(\sigma^{2}+m \sigma_{3}^{2}\right) I_{b k-b-t+1} \\
& U_{77}=\sigma^{2} I_{b k(m-1)}
\end{aligned}
$$

We must now determine the form of $P^{1} \mathbb{Z}^{-1} P$. To evaluate this we note that $(P \cdot \mathbb{Z} P P)^{-1}=P \mathscr{Z}^{-1} P$. The form of $P^{\prime} \mathbb{Z}^{-1} P$ is given in Table IX.

Form of $\mathrm{P}^{\prime} \mathrm{Z}^{-1} \mathrm{P}$ for Singular GD-PBIB Designs:

Table IX
$\left[\begin{array}{ccccccc}\mathrm{W}_{11} & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \mathrm{~W}_{22} & \phi & \phi & \phi & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{33} & \mathrm{~W}_{34} & \phi & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{43} & \mathrm{~W}_{44} & \phi & \phi & \phi \\ \phi & \phi & \phi & \phi & \mathrm{~W}_{55} & \phi & \phi \\ \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{66} & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{77}\end{array}\right]$
where

$$
\begin{aligned}
& \mathrm{W}_{11}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} \\
& \mathrm{~W}_{22}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)^{-1} I_{c_{0}}+c_{1}^{\prime} \\
& W_{33}=d_{1}^{-1}\left(\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} I_{g-1}
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{W}_{34}=\mathrm{W}_{43}=-\mathrm{d}_{1}^{-1}\left[\mathrm{~m}^{2} \mathrm{k}^{-2}\left(\ddagger \mathrm{k}-\lambda_{2} \mathrm{t}\right) \lambda_{2} \mathrm{t}\right]^{1 / 2} \sigma_{2} 2_{\mathrm{I}} g-1 \\
& \mathrm{~W}_{44}=\mathrm{d}_{1}^{-1}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2}{ }^{t) \sigma_{2}^{2}}+m \sigma_{3}^{2}\right] I_{g-1}\right. \\
& W_{55}=\left(m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right)^{-1} I_{g(n-1)} \\
& W_{66}=\left(\sigma^{2}+m \sigma_{3}^{2}\right)^{-1} I_{b k-b-t+1} \\
& W_{77}=\left[\sigma^{2}\right]^{-1} I_{b k(m-1)} \\
& d_{1}=\sigma^{4}+m k \sigma^{2} \sigma_{1}^{2}+m r \sigma^{2} \sigma_{2}^{2}+2 m \sigma^{2} \sigma_{3}^{2}+m^{2} \lambda_{2} t \sigma_{1}^{2}{ }_{2}^{2}+m^{2}{ }_{k \sigma}{ }_{1}^{2} \sigma_{3}^{2} \\
& +m^{2} r \sigma_{2}^{2} \sigma_{3}^{2}+m^{2} \sigma_{3}^{4} .
\end{aligned}
$$

Evaluating $P^{\prime}(Y-\bar{\mu})$ we have

Performing the multiplication $(Y-\bar{\mu})^{\prime} P P^{\prime} \not \mathbb{Z}^{-1} P P^{\prime}(Y-\bar{\mu})=q\langle$ say $\rangle$, we have

$$
\begin{aligned}
& q=(b k m)\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1}(y \cdots-\mu)^{2} \\
& +\left[\mathrm{km}\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{t} X_{1}^{t} Y \\
& +\left[k \mathrm{~km}_{1}\right]^{-1}\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{l} X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime} Y \\
& +\left[m\left(\sigma^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{i} Y+\sigma^{-2} Y^{t} P_{5} P_{5}^{i} Y \\
& +\left(\frac{k}{\lambda_{2} t m}\right)\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} \mathrm{Y} \\
& +\left[r m\left(m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right)\right]^{-1} Y^{\prime} A P_{32} P_{32}^{\prime} A^{\prime} Y \\
& -2 d_{1}^{-1}\left[m^{2} k^{-2}\left(r k-\lambda_{2} t\right) \lambda_{2} t\right]^{1 / 2} \sigma_{2}^{2} Y^{\prime} X_{1} P_{22^{\prime}}{ }_{31}{ }_{31} A^{\prime} Y\left(\frac{1}{\lambda_{2}{ }^{t m}}\right)^{1 / 2}
\end{aligned}
$$

Define the eight statistics $s_{i}(i=1,2, \ldots, 8)$ as follows:

$$
\begin{aligned}
& s_{1}=y \ldots \\
& s_{2}=(k m)^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \quad \text { if } b>g \text {, not defined if } b=g \text {. } \\
& s_{3}=(k m)^{-1} Y^{\prime} X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime} Y \\
& s_{4}=\left(\frac{k}{\lambda_{2}{ }^{\operatorname{tm}}}\right) Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} Y \\
& \mathrm{~s}_{5}=(\mathrm{rm})^{-1} \mathrm{Y}^{\mathrm{I}} \mathrm{AP}_{32} \mathrm{P}_{32^{\prime}} \mathrm{A}^{\mathrm{t}} \mathrm{Y} \\
& s_{6}=m^{-1} Y^{t} F P_{4} P_{4}^{\prime} F^{\prime} Y \\
& s_{7}=Y^{t} P_{5} P_{5}^{1} Y \\
& s_{8}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{22^{\prime}} P_{31}^{\prime} A^{I} Y
\end{aligned}
$$

These eight statistics are sufficient for the parameters $\mu, \sigma^{2}, \sigma_{1}^{2}, \sigma_{2}^{2}$, and $\sigma_{3}^{2}$. This follows from [7] and we shall show that these eight
statistics form a minimal set of sufficient statistics by following the same procedure as we had for the BIB designs.
$g(Y, \theta)$ may be written in the form,

$$
g(Y, \theta)=P(Q) Q(Y) \exp \left[-\frac{1}{2} \sum_{i=1}^{k} v_{i}(\theta) u_{i}(Y)\right]
$$

A necessary and sufficient condition for the set of sufficient statistics $u_{i}(Y)$ to be minimal for $g(Y, \theta)$ is that there exist no non-zero constants $a_{1}, a_{2}, \cdots, a_{k}, c$, such that

$$
\begin{equation*}
\sum_{i=1}^{k} a_{i} v_{i}(\theta)=c \tag{IV}
\end{equation*}
$$

Thus it is enough to prove that for the following nine functions:

$$
\begin{aligned}
v_{1} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
v_{2} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
v_{3} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} \\
v_{4} & =\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} \\
\text { (V) } v_{5} & =-2 \sigma_{2}^{2} d_{1}^{-1} \\
v_{6} & =\left(\sigma^{2}+m \sigma_{3}^{2}\right)^{-1} \\
v_{7} & =\sigma^{-2} \\
v_{8} & =\left[m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right]^{-1} \\
v_{9} & =v_{1} \mu
\end{aligned}
$$

(IV) is not true for any $a_{1}, a_{2}, \ldots, a_{9}$, and $c$ except when all vanish. In (V) it is clear that $\mu$ appears only in $v_{9}$. Since $v_{1}, v_{2}, \ldots, v_{8}$ are homogeneous functions of $\sigma_{,} \sigma_{1}, \sigma_{2}$, and $\sigma_{3}$ of degree -2, the constant can only be zero.

Effect the linear transformation,

$$
\begin{aligned}
& x=\sigma^{2} \\
& y=\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2} \\
& z=\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2} \\
& u=m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2} \\
& w=\sigma^{2}+m \sigma_{3}^{2} .
\end{aligned}
$$

The functions in (V) become:

$$
\begin{aligned}
& v_{1}=\operatorname{xyuw}\left[z w+\frac{\lambda_{2} t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{2}=x z u w\left[z w+\frac{\lambda_{2} t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{3}=x y z u w\left[y-\frac{\left(r k-\lambda_{2} t\right)}{r k}(z-y)\right] D^{-1} \\
& v_{4}=x y z u w\left[w+\frac{\lambda_{2} t}{r k}(z-y)\right] D^{-1} \\
& v_{5}=-2 x y z u w\left[\frac{z-y}{m r}\right] D^{-1} \\
& v_{6}=\operatorname{xyzu}\left[z w+\frac{\lambda_{2} t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{7}=\operatorname{yzuw}\left[z w+\frac{\lambda_{2} t}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{8}=\operatorname{xyzw}\left[z w+\frac{\lambda_{2} t}{r k}(z-y)(y-w)\right] D^{-1}
\end{aligned}
$$

where $D=$ xyzuw $\left[z w+\frac{\lambda_{2}{ }^{t}}{r k}(z-y)(y-w)\right]$.
Observe that the term $x y^{2} u w^{2}$ appears only in $v_{1}, x z^{2} u^{2}$ appears only in $v_{2}, x y^{2} z^{2} w$ appears only in $v_{6}, y z^{2} u w^{2}$ appears only in $v_{7}$, and $x y z^{2} w^{2}$ appears only in $v_{8}$. This implies $v_{1}, v_{2}, v_{6}, v_{7}$, and $v_{8}$ are mutually linearly independent of $\mathrm{v}_{3}, \mathrm{v}_{4}$, and $\mathrm{v}_{5}$. Now observe that after removing the common factor xyzuw in $v_{3}, v_{4}$, and $v_{5}$, these are also linearly independent, thereby proving that (IV) is not true unless $a_{1}, a_{2}, \ldots, a_{7}$, and $c$ vanish. This condition then implies the set of sufficient statistics defined in (IV) are minimal.

Summarizing the results for singular GD-PBIB Designs, we have the following theorem and corollaries:

Theorem 2: If an Eisenhart Model II is assumed in a singular, group
divisible, partially balanced incomplete block design with two
associate classes, then there are eight statistics in a minimal
set of sufficient statistics if $b>g$ and seven statistics if $b=g$.
Corollary 2.1. The explicit form of a set of minimal sufficient statistics
for a singular GD-PBIB design are as follows:

$$
\begin{aligned}
& s_{1}=y \ldots \\
& s_{2}=(m k)^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \text { if } b>g \text { and is not defined if } b=g . \\
& s_{3}=(m k)^{-1} Y^{\prime} X_{1} P_{22^{\prime}} P_{22}^{\prime} X_{1}^{\prime} Y \text { or }\left[m^{3} k\left(r k-\lambda_{2} t\right)\right]^{-1} Y^{\prime} X_{1} N^{\prime} P_{31} P_{31}^{\prime} N X_{1}^{\prime} Y \\
& s_{4}=\left(\frac{k}{\lambda_{2} t m}\right) Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} Y \\
& s_{5}=(r m)^{-1} Y^{\prime} A P_{32} P_{32}^{\prime} A^{\prime} Y \\
& s_{6}=m^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{\prime} Y
\end{aligned}
$$

$$
\begin{aligned}
& s_{7}=Y^{i} P_{5} P_{5}^{\prime} Y \\
& s_{8}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{22^{2}} P_{31}^{\prime} A^{\prime} Y \text { or } k^{-1} m^{-1} Y^{\prime} X_{1} N^{\prime} P_{31} P_{31}^{\prime} A^{\prime} Y
\end{aligned}
$$

Corollary 2.2. The distributions of eight statistics as given in Corol-
lary 2.1 are as follows:
$s_{1} \sim N\left[\mu,(b k m)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+\sigma^{2}\right)\right]$
$s_{2} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] X_{b-g}^{2}$ if $b>g$ and is not defined if $b=g$.
$s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right] X_{g-1}^{2}$
$s_{4} \sim\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right] x_{g-1}^{2}$
$s_{5} \sim\left[\sigma^{2}+m r \sigma_{2}^{2}\right] x_{g(n-1)}^{2}$
$s_{6} \sim\left[\sigma^{2}+m \sigma_{3}^{2}\right] X_{b k-b-t+1}^{2}$
$s_{7} \sim\left[\dot{\sigma}^{2}\right] X_{b k(m-1)}^{2}$
$s_{8} \sim \mathbb{Z} a_{i} X_{(1)}^{2}$ where $a_{i}$ are non-zero characteristic roots of $s^{-1}\left[A_{7}+A_{7}^{1}\right] \not \nmid$ where $A_{7}=m^{-1} k^{-1} X_{1} N^{\prime} P_{31} P^{1}{ }_{31} A^{1}$.

For proof of this corollary, see Appendix III.
Corollary 2. 3. The statistics as defined in Corollary 2.1 are painwise
independent except for the pairs $\left(s_{3}, s_{4}\right),\left(s_{3}, s_{8}\right)$, and $\left(s_{4}, s_{8}\right)$.
For proof of this corollary, see Appendix IV.
Corollary 2.4. The expectations of the eight statistics as defined in
Corollary 2.1 are as follows:

$$
E\left(s_{1}\right)=\mu_{1}
$$

$$
\begin{aligned}
& E\left(s_{2}\right)=(b-g)\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{3}\right)=(g-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-7}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right] \\
& E\left(s_{4}\right)=(g-1)\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right] \\
& E\left(s_{5}\right)=g(n-1)\left[\sigma^{2}+m r \sigma_{2}^{2}\right] \\
& E\left(s_{6}\right)=(b k-b-t+1)\left[\sigma^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{7}\right)=b k(m-1) \sigma^{2} \\
& E\left(s_{8}\right)=m^{2}-2(g-1)\left(r k-\lambda_{2} t\right)\left(\lambda_{2} t\right) \sigma_{2}^{2}
\end{aligned}
$$

For proof of this corollary see Appendix III.

## Semi-Regular GD-PBIB Designs.

In Appendix II $P^{\prime} \neq \mathrm{P}$ is shown to be of the form as given in Table X .

Table X
$\left[\begin{array}{ccccccc}\mathrm{U}_{11} & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \mathrm{U}_{22} & \phi & \phi & \phi & \phi & \phi \\ \phi & \phi & \mathrm{U}_{33} & \phi & \mathrm{U}_{35} & \phi & \phi \\ \phi & \phi & \phi & \mathrm{U}_{44} & \phi & \phi & \phi \\ \phi & \phi & \mathrm{U}_{53} & \phi & \mathrm{U}_{55} & \phi & \phi \\ \phi & \phi & \phi & \phi & \phi & \mathrm{U}_{66} & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{U}_{77}\end{array}\right]$
where

$$
U_{11}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)
$$

$$
\begin{aligned}
& U_{22}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) I_{c_{0}}+c_{1}^{1} \\
& U_{33}=\left[\sigma^{2}+m k \dot{\sigma}_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] I_{g(n-1)} \\
& U_{35}=U_{53}=m k^{-1}\left[\left(r-\lambda_{1}\right) v\right]^{1 / 2} \sigma_{2}^{2} I_{g(n-1)} \\
& U_{44}=\left(\sigma^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right) I_{g-1} \\
& U_{55}=\left(m v \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right) I_{g(n-1)} \\
& U_{66}=\left(\sigma^{2}+m \sigma_{3}^{2}\right) I_{b k-b-t+1} \\
& U_{77}=\sigma^{2} I_{b k(m-1)}
\end{aligned}
$$

In order to determine $P^{1 / 4} \mathbb{Z}^{-1} P$, we shall use the relation $\left(P^{1} \nmid P\right)^{-1}=$ $P^{\prime} Z^{-1} P$. The form of $P^{\prime} \mathcal{L}^{-1} P$ is given in Table XI.

Table XI
$\left[\begin{array}{ccccccc}\mathrm{W}_{11} & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \mathrm{~W}_{22} & \phi & \phi & \phi & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{33} & \phi & \mathrm{~W}_{35} & \phi & \phi \\ \phi & \phi & \phi & \mathrm{~W}_{44} & \phi & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{53} & \phi & \mathrm{~W}_{55} & \phi & \phi \\ \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{66} & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{77}\end{array}\right]$
where

$$
\begin{aligned}
& \mathrm{W}_{11}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
& \mathrm{~W}_{22}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]^{-1} \mathrm{I}_{\mathrm{c}_{0}}+\mathrm{c}_{1}^{1}
\end{aligned}
$$

$$
\begin{aligned}
& W_{33}=\left[m v \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] d_{2}^{-1} I_{g(n-1)} \\
& W_{35}=W_{53}^{1}=-\left[m k^{-1}\left[\left(r-\lambda_{1}\right) v\right]^{1 / 2}\right] \sigma_{2}^{2} d_{2}^{-1} \mathrm{I}(n-1) \\
& W_{44}=\left[\sigma^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} I_{g-1} \\
& W_{55}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] I_{g(n-1)} d_{2}^{\sim 1} \\
& W_{66}=\left[\sigma^{2}+m \sigma_{3}^{2}\right]^{-1} I_{b k-b-t+1} \\
& W_{77}=\sigma^{-2} \mathrm{I}_{\mathrm{bk}(\mathrm{~m}-1)} \\
& d_{2}=\sigma^{4}+m k \sigma^{2} \sigma_{1}^{2}+m r \sigma^{2} \sigma_{2}^{2}+2 m \sigma^{2} \sigma_{3}^{2}+m^{2}\left(r k-r+\lambda_{1}\right) \sigma_{1}^{2}{ }^{2} \\
& +m^{2}{ }_{k \sigma}{ }_{1}{ }^{\sigma}{ }_{3}^{2}+m^{2} r \sigma_{2} \sigma_{3}^{2}+m^{2} \sigma_{3}^{4} .
\end{aligned}
$$

We shall now ascertain the form $P^{\prime}(Y-\bar{\mu})$. This is equal to:

$$
P^{\prime}(Y-\bar{\mu})=\left[\begin{array}{l}
(\mathrm{bkm})^{-1 / 2}(y \ldots-\mu) \\
(\mathrm{km})^{-1 / 2} P_{21}^{\prime} X_{1}^{\imath} Y \\
(\mathrm{~km})^{-1 / 2} P_{23}^{\prime} X_{1}^{\prime} Y \\
(m x)^{-1 / 2} P_{31}^{t} A^{t} Y \\
(m v)^{-1 / 2} P_{32^{\prime}}^{\prime} A^{\prime} Y \\
m^{-1 / 2} P_{4}^{t} F^{\prime} Y \\
P_{5}^{\prime} Y
\end{array}\right]
$$

Performing the multiplication we have for $(\mathbb{Y}-\vec{\mu}) P P^{\prime} \not \mathbb{Z}^{-1} P P^{\prime}(Y-\bar{\mu})=q$, where

$$
\begin{aligned}
q= & (b k m)\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1}(y \ldots-\mu)^{2} \\
& +\left[k m\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y_{1}^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \\
& +\left[k m d_{2}\right]^{-1}\left[\sigma^{2}+m v \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{\prime} X_{1} P_{23^{\prime}} P_{23}^{\prime} X_{1}^{\prime Y} \\
& +\left[m\left(\sigma^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{\prime} Y+\sigma^{-2} Y^{\prime} P_{5} P_{5}^{\prime} Y \\
& +\left[m r\left(\sigma^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} Y \\
& +\left[m v d_{2}\right]^{-1}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{\prime} A P_{32} P_{32}^{\prime} A^{\prime} Y \\
& -2 d_{2}^{-1}\left[k^{-2}\left(r-\lambda_{1}\right)\right]^{1 / 2} \sigma_{\sigma_{2}}^{2} Y^{\prime} X_{1} P_{23} P_{23}^{\prime} A^{\prime} Y
\end{aligned}
$$

Define the eight statistics $s_{i}=(1,2,3, . . ., 8)$ as follows:

$$
\left(\mathrm{IIT}^{1}\right)
$$

$$
\begin{aligned}
& s_{1}=y \cdot \\
& s_{2}=(\mathrm{km})^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \\
& s_{3}=(\mathrm{km})^{-1} Y^{\prime} X_{1} P_{23^{\prime}} P_{23^{\prime}} X_{1}^{\prime} Y \\
& s_{4}=(m r)^{-1} Y^{\prime} A P_{31} P_{31}^{1} A^{\prime} Y \\
& s_{5}=(m)^{-1} Y^{\prime} A P_{32^{\prime}} P_{32}^{1} A^{\prime} Y \\
& s_{6}=m^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{\prime} Y \\
& s_{7}=Y^{\prime} P_{5} P_{5}^{\prime} Y \\
& s_{8}=\left[m^{-1 / 2}\left(r-\lambda_{1}\right)^{1 / 2}\right] Y^{\prime} X_{1} P_{23} P_{32}^{1} A^{\prime} Y
\end{aligned}
$$

These eight statistics are sufficient for the parameters $\mu, \sigma^{2}$, $\sigma_{1}^{2}, \sigma_{2}^{2}, \sigma_{3}^{2}$. This follows from [7], and we shall show that these eight statistics form a minimal set of sufficient statistics by following the same procedure as we had for the BIB designs.
$g(Y, \theta)$ may be written in the form
(IV ${ }^{1}$

$$
g(Y, \theta)=P(\theta) Q(Y) \exp \left[-\frac{1}{2} \sum_{i=1}^{k} v_{i}(\theta) u_{i}(Y)\right]
$$

A necessary and sufficient condition for the set of sufficient statistics $u_{i}(Y)$ to be minimal for $g(Y, \theta)$ is that there exists no non-zero constants $a_{1}, a_{2}, \cdots, a_{k}, c$ such that

$$
\underset{i=1}{k} a_{i} v_{i}\left(\theta_{i}\right)=c
$$

Thus it is enough to prove that for the following nine functions:

$$
\begin{aligned}
v_{1} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
v_{2} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
v_{3} & =\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{2}^{-1} \\
v_{4} & =\left[\sigma^{2}+m v \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{2}^{-1} \\
\left(v^{\prime}\right) v_{5} & =-2 \sigma_{2}^{2} d_{2}^{-1} \\
v_{6} & =\left(\sigma^{2}+m \sigma_{3}^{2}\right)^{-1} \\
v_{7} & =\sigma^{-2} \\
v_{8} & =\left(\sigma^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} \\
v_{9} & =v_{1} \mu
\end{aligned}
$$

(IV') is not true for any $a_{1}, a_{2}, \ldots, a_{9}$, and $c$ except when all vanish. In $\left(V^{\prime}\right)$ it is clear that $\mu$ appears only in $v_{9}$ : Since $v_{1}, v_{2}, \ldots, v_{8}$ are homogeneous functions of $\sigma_{,} \sigma_{1}, \sigma_{2}$, and $\sigma_{3}$ of degree -2 , the constant c can only be zero.

Effect the linear transformation,

$$
\begin{aligned}
& x=\sigma^{2} \\
& y=\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2} \\
& z=\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2} \\
& u=m r \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2} \\
& w=\sigma^{2}+m \sigma_{3}^{2}
\end{aligned}
$$

The functions in ( $V^{\prime}$ ) become:

$$
\begin{aligned}
& v_{1}=(x y u w)\left[z w+\frac{v}{r}(z-y)(y-w)\right] D^{-1} \\
& v_{2}=(x z u w)\left[z w+\frac{v}{r}(z-y)(y-w)\right] D^{-1} \\
& v_{3}=(x y z u w)\left[y-\frac{\left(r-\lambda_{1}\right)}{r k}(z-y)\right] D^{-1} \\
& v_{4}=\operatorname{xyzuw}\left[w+\frac{v}{r}(z-y)\right] D^{-1} \\
& v_{5}=-2 x y z u w\left[\frac{z-y}{m r}\right] D^{-1} \\
& v_{6}=\operatorname{xyzu}\left[z w+\frac{v}{r}(z-y)(y-w)\right] D^{-1} \\
& \dot{v}_{7}=\operatorname{yzuw}\left[z w+\frac{v}{r}(z-y)(y-w] D^{-1}\right. \\
& v_{8}=\operatorname{xyzw}\left[z w+\frac{v}{r}(z-y)(y-w)\right] D^{-1}
\end{aligned}
$$

where
$D^{--}=\operatorname{xyzuw}\left[z w+\frac{{ }^{\mathrm{v}}}{2} \mathrm{rk}(\mathrm{z}-\mathrm{y})(\mathrm{y}-\mathrm{w})\right]$

By following the process exactly similar to that for S-GD-PBIB designs we can conclude the set of sufficient statistics defined in (IV') are minimal. Hence from the above discussions we have the following theorems and corollaries.

Theorem 3. In a semi-regular group divisible, partially balanced in-
complete block design with two associate classes there are eight
statistics in a minimal set of sufficient statistics if $b>t-g+1$
and seven statistics in a minimal set if $\mathrm{b}=\mathrm{t}-\mathrm{g}+1$.
Corollary 3.1. The explicit form of the statistics in a minimal set of
sufficient statistics in a SR-GD-PBIB design are as follows:
$s_{1}=y .$.
$s_{2}=(m k)^{-1} Y^{\prime} X_{1} P_{21} P_{21}{ }^{\mathrm{s}} \mathrm{X}_{1}^{\prime} \mathrm{Y} \quad$ if $\mathrm{b}>\mathrm{t}-\mathrm{g}+1$; not defined if $\mathrm{b}=\mathrm{t}-\mathrm{g}+1$
$s_{3}=(m k)^{-1} Y^{\prime} X_{1} P_{23^{\prime}} P_{23^{\prime}} X_{1}^{I Y}$ or $\left[m^{2} k(r-x)\right]^{-1} Y^{i} X_{1} P_{32} P_{32^{\prime}} N_{1}^{\prime} Y$
$s_{4}=(m r)^{-1} Y^{\prime} A P_{31} P_{31}^{t} A^{\prime} Y$
$s_{5}=(m v)^{-1} Y^{\prime} A P_{32} P_{32}^{\prime} A^{\prime} Y$
$s_{6}=(m)^{-1} Y^{i} F P_{4} P_{4}^{\prime} F^{\prime} Y$
$s_{7}=Y^{\prime} P_{5} P_{5}^{\prime} Y$
$s_{8}=\left[m^{2} k^{-2}\left(r-\lambda_{1}\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{23} P_{32}^{\prime} A^{\prime} Y=k^{-1} Y^{\prime} X_{1} N^{\prime} P_{32} P_{32}^{\prime} A^{\prime} Y$

Corollary 3.2. The distribution of each of the statistics as given in
Corollary 3.1 is as follows:
$s_{1} \sim N\left[\mu,(\mathrm{bkm})^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]$
$s_{2} \sim\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) X_{(b-t+g-1)}^{2}$
$s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \chi_{g(n-1)}^{2}$
$s_{4} \sim\left[\sigma^{2}+m \sigma_{2}^{2}\right] \chi_{(g-1)}^{2}$
$s_{5} \sim\left[\sigma^{2}+m v \sigma_{2}^{2}\right] \chi_{g(n-1)}^{2}$
$s_{6} \sim\left[\sigma^{2}+m \sigma_{3}^{2}\right] x_{(b k-b-t+1)}^{2}$
$s_{7} \sim \sigma^{2} \chi_{[b k(m-1)]}^{2}$
$s_{8} \sim \quad \boldsymbol{\Sigma}_{\mathrm{i}} \chi_{(1)}^{2}$ where the $\mathrm{a}_{\mathrm{i}}$ are the non-zero characteristic roots of $2^{-1}\left(A_{7}+A_{7}^{\prime}\right) \not \nVdash$ where $A_{7}=k^{-1} X_{1} N^{\prime} P_{32} P_{32}^{\prime} A^{\prime}$.

For proof of this corollary, see Appendix III.
Corollary 3.3. The eight statistics as given in Corollary 3.1 are
pairwise independent except for the pairs $\left(s_{3}, s_{5}\right),\left(s_{3}, s_{8}\right)$, and
$\left(s_{5}, s_{8}\right)$.
For proof of this corollary, see Appendix IV.
Corollary 3.4. The expectations of the eight statistics as given in
Corollary 3.1 are as follows:

$$
\begin{aligned}
& E\left(s_{1}\right)=\mu \\
& E\left(s_{2}\right)=(b-t+g-1)\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
& E\left(s_{3}\right)=g(n-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{4}\right)=(g-1)\left[\sigma^{2}+m r \sigma_{2}^{2}\right] \\
& E\left(s_{5}\right)=g(n-1)\left[\sigma^{2}+m v \sigma_{2}^{2}\right] \\
& E\left(s_{6}\right)=\left[\sigma^{2}+m \sigma_{3}^{2}\right][b k-b-t+1] \\
& E\left(s_{7}\right)=\sigma^{2}[b k(m-1)] \\
& E\left(s_{8}\right)=g(n-1) m^{3}\left(r-\lambda_{1}\right)\left(r k-r+\lambda_{1}\right) k^{-2} \sigma_{2}^{2}
\end{aligned}
$$

For proof of this corollary, see Appendix III.

## Regular GD-PBIB Designs,

In order to derive the elements of $P \not Z P$, we shall make use of the results derived for $S$ and SR-GD-PBIB designs. $P^{\prime} \notin P$ will be of the form as given in Table XII.

Table XII
$\left[\begin{array}{cccccccc}\mathrm{U}_{11} & \phi & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \mathrm{U}_{22} & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \phi & \mathrm{U}_{33} & \phi & \mathrm{U}_{35} & \phi & \phi & \phi \\ \phi & \phi & \phi & \mathrm{U}_{44} & \phi & \mathrm{U}_{46} & \phi & \phi \\ \phi & \phi & \mathrm{U}_{53} & \phi & \mathrm{U}_{55} & \phi & \phi & \phi \\ \phi & \phi & \phi & \mathrm{U}_{64} & \phi & \mathrm{U}_{66} & \phi & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{U}_{77} & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{U}_{88}\end{array}\right]$
where

$$
\begin{aligned}
& U_{11}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right) \\
& U_{22}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) I_{b-t} \\
& U_{33}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] I_{g-1} \\
& U_{35}=U_{53}=m k^{-1}\left[\left(r k-\lambda_{2} t\right) \lambda_{2} t\right]^{1 / 2} 2_{2}^{2} I_{g-1} \\
& U_{44}=\left[m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] I_{g(n-1)} \\
& U_{46}=U_{64}=m k^{-1 / 2}\left[\left(r-\lambda_{1}\right) v\right]^{1 / 2} \sigma_{2}^{2} I_{g(n-1)} \\
& U_{55}=\left[m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] I_{g-1} \\
& U_{66}=\left[m v \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] I_{g(n-1)} \\
& U_{77}=\left[\sigma^{2}+m \sigma_{3}^{2}\right] I_{b k-b-t+1} \\
& U_{88}=\sigma^{2} I_{b k(m-1)}
\end{aligned}
$$

The form of $P^{\prime} \mathbb{Z}^{-1} P$ is given in Table XIII.
Table XIII
$\left[\begin{array}{cccccccc}\mathrm{W}_{11} & \phi & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \mathrm{~W}_{22} & \phi & \phi & \phi & \phi & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{33} & \phi & \mathrm{~W}_{35} & \phi & \phi & \phi \\ \phi & \phi & \phi & \mathrm{~W}_{44} & \phi & \mathrm{~W}_{46} & \phi & \phi \\ \phi & \phi & \mathrm{~W}_{53} & \phi & \mathrm{~W}_{55} & \phi & \phi & \phi \\ \phi & \phi & \phi & \mathrm{~W}_{64} & \phi & \mathrm{~W}_{66} & \phi & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{77} & \phi \\ \phi & \phi & \phi & \phi & \phi & \phi & \phi & \mathrm{~W}_{88}\end{array}\right]$

$$
\begin{aligned}
& \mathrm{W}_{11}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} \\
& \mathrm{~W}_{22}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)^{-1} I_{b-t} \\
& W_{33}=\left[m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] d_{1}^{-1} I_{g-1} \\
& W_{35}=W_{53}=-m k^{-1}\left[\left(r k-\lambda_{2} t\right) \lambda_{2} t\right]^{1 / 2_{d_{1}}^{-1} \sigma_{2}^{2} I_{g-1}} \\
& W_{44}=\left[m v \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] d_{2}^{-1} I_{g(n-1)} \\
& W_{46}=W_{64}=-\left[m k^{-1 / 2}\left[\left(r-\lambda_{1}\right) v\right]^{1 / 2}\right] \sigma_{2}^{2} I_{g(n-1)} \\
& W_{55}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k{ }^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} I_{g-1} \\
& W_{66}=\left[m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] d_{2}^{-1} I_{g(n-1)} \\
& W_{77}=\left[\sigma^{2}+m \sigma_{3}^{2}\right]^{-1} I_{b k-b-t+1} \\
& W_{88}=\sigma^{-2} I_{b k(m-1)}
\end{aligned}
$$

$d_{1}$ and $d_{2}$ are the same as those given in Singular and Semi-Regular GD-PBIB Designs, respectively.

Evaluating $P^{\prime}(Y-\bar{\mu})$, we have

$$
P^{\prime}(Y-\bar{\mu})=\left[\begin{array}{l}
(\mathrm{bkm})^{1 / 2}(\mathrm{y} \ldots-\mu) \\
(\mathrm{km})^{-1 / 2} \mathrm{P}_{21}^{\prime} X_{1}^{\prime Y} \\
(\mathrm{~km})^{-1 / 2}{ }_{P_{22}^{\prime}} X_{1}^{\prime} Y \\
(\mathrm{~km})^{-1 / 2} \mathrm{P}_{23}^{\prime} X_{1}^{\prime} Y \\
\left(\frac{\mathrm{k}}{\left.\lambda_{2}^{\mathrm{tm}}\right)^{1 / 2} \mathrm{P}_{31}^{\prime} A^{\prime} Y}\right. \\
(\mathrm{mv})^{-1 / 2} \mathrm{P}_{32^{\prime}} A^{\prime} Y \\
m^{-1 / 2} P_{4}^{\prime} F^{\prime} Y \\
P_{5}^{\prime Y}
\end{array}\right]
$$

Performing the multiplication $(Y-\bar{\mu})^{\prime} \mathrm{PP}^{\prime} \mathcal{Z}^{-1} \mathrm{PP}^{\prime}(\mathrm{Y}-\bar{\mu})=\mathrm{q}($ say $)$, we have

$$
\begin{aligned}
& q=(b k m)\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1}(y \cdots-\mu)^{2} \\
& +\left[k m\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)\right]^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y \\
& +\left[\mathrm{kmd}_{1}\right]^{-1}\left[\sigma^{2}+m k^{-1} \lambda_{2} \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{\prime} X_{1} P_{22^{\prime}} P_{22}^{\prime} X_{1}^{\prime Y} \\
& +\mathrm{d}_{2}^{-1}(\mathrm{~km})^{-1}\left[\mathrm{mv} \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{23}^{1} \mathrm{X}_{1}^{\prime} \mathrm{Y} \\
& +\left[m\left(\sigma^{2}+m \sigma_{3}^{2}\right)\right]^{-1} \mathrm{Y}^{\prime} \mathrm{FP}_{4} \mathrm{P}_{4}{ }^{1 \mathrm{~F}} \mathrm{Y}+\sigma^{-2} \mathrm{Y}^{4} \mathrm{P}_{5} \mathrm{P}_{5}^{\mathrm{t}} \mathrm{Y} \\
& +\frac{k}{\lambda_{2} t m}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2}{ }^{t}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}{ }^{2} d_{1}^{-1} Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} Y\right. \\
& +\left[\operatorname{mvd}_{2}\right]^{-1}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] Y^{\prime} \mathrm{AP}_{32} \mathrm{P}_{32^{\prime}} \mathrm{A}^{\mathrm{I}} \mathrm{Y} \\
& \left.-2 d_{1}^{-1}\left[\mathrm{~m}^{2} \mathrm{k}^{-2}\left(\mathrm{rk}-\lambda_{2} \mathrm{t}\right) \lambda_{2}{ }^{\mathrm{t}}\right]^{1 / 2}\right] \sigma_{2}^{2} \mathrm{Y}^{\mathrm{t}} \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{32^{\prime}} \mathrm{A}^{\prime} \mathrm{Y}\left(\mathrm{~m}^{2} \mathrm{kv}\right)^{-1 / 2}
\end{aligned}
$$

$$
-2 \mathrm{~d}_{2}^{-1}\left[\mathrm{mk}^{-1 / 2}\left[\left(\mathrm{r}-\lambda_{1}\right) \mathrm{v}\right]^{1 / 2}\right] \sigma_{2}^{2} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{32^{\prime}} \mathrm{A}^{\prime} \mathrm{Y}\left(\mathrm{~m}^{2} \mathrm{kv}\right)^{-1 / 2}
$$

Define the ten statistics as follows:

$$
\begin{aligned}
& s_{1}=y \ldots \\
& s_{2}=(k m)^{-1} Y^{\prime} X_{1} P_{21} P^{\prime}{ }_{21} X_{1}^{\prime} Y \quad \text { (not defined for } b=t \text { ) } \\
& \mathbf{s}_{3}=(\mathrm{km})^{-1} \mathrm{Y}^{\boldsymbol{\imath}} \mathrm{X}_{1} \mathbf{P}_{22^{2}}{ }_{22}^{\mathbf{\prime}} \mathbf{X}_{1}^{\prime} \mathrm{Y} \\
& s_{4}=(\mathrm{km})^{-1} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{P}_{23^{\prime}} \mathrm{P}_{23}^{\prime} \mathrm{X}_{1}^{\prime} \mathrm{Y} \\
& \mathbf{s}_{5}=\frac{k}{\lambda_{2}{ }^{\operatorname{tm}}} Y^{t} A P_{31} P_{31}^{\mathrm{t}} A^{\prime} Y \\
& s_{6}=(m v)^{-1} Y^{\prime} A P_{32} P_{32}^{1} A^{I} Y \\
& s_{7}=m^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{\prime} Y \\
& s_{8}=Y^{\prime} P_{5} P_{5}^{!} Y \\
& s_{9}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{22} P_{31}^{\prime} A^{t} Y \\
& s_{10}=\left[k^{-2}\left(r-\lambda_{1}\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{23} P_{32}^{\prime} A^{\prime} Y
\end{aligned}
$$

These ten statistics aresufficient for the parameters $\mu, \sigma^{2}, \sigma_{1}^{2}$, $\sigma_{2}^{2}, \sigma_{3}^{2}$. This follows from [7], and we shall show that these ten statistics form a minimal set of sufficient statistics by following the same procedure as we had for the BIB designs.
$g(Y, \theta)$ may be written in the form

$$
g(Y, \theta)=P(\theta) Q(Y) \exp \left[-2^{-1} \underset{i=1}{k} v_{i}(\theta) u_{i}(Y)\right]
$$

A necessary and sufficient condition for the set of sufficient statistics $u_{i}(Y)$ to be minimal for $g(Y, \theta)$ is that there exist no non-zero constants $a_{1}, a_{2}, \ldots ., a_{k}, c$ such that

$$
\sum_{i=1}^{k} a_{i} v_{i}\left(\theta_{i}\right)=c
$$

Thus it is enough to prove that for the following eleven functions,

$$
\begin{aligned}
& v_{1}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
& v_{2}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]^{-1} \\
& v_{3}=\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1} \\
& v_{4}=\left[\sigma^{2}+m v \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{2}^{-1} \\
& v_{5}=-2 \sigma_{2}^{2} d_{1}^{-1} \\
& v_{6}=-2 \sigma_{2}^{2} d_{2}^{-1} \\
& v_{7}=\left(\sigma^{2}+m \sigma_{3}^{2}\right)^{-1} \\
& v_{8}=\sigma^{-2} \\
& v_{9}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{2}^{-1} \\
& v_{10}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2}^{\left.t) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] d_{1}^{-1}}\right.\right. \\
& v_{11}=v_{1}^{\mu}
\end{aligned}
$$

(IV'I) is not true for any $a_{1}, a_{2}, \ldots, a_{11}$ and $c$ except when all vanish.
In ( $V^{\prime \prime}$ ) it is clear that $\mu$ appears only in $v_{11}$. Since $v_{1}, v_{2}, \ldots, v_{10}$ are homogeneous functions of $\sigma_{,} \sigma_{1}, \sigma_{2}$, and $\sigma_{3}$ of degree -2 , the constant c can only be zero.

Effect the linear transformation,

$$
\begin{aligned}
& x=\sigma^{2} \\
& y=\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2} \\
& z=\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2} \\
& u=m k \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2} \\
& w=\sigma^{2}+m \sigma_{3}^{2}
\end{aligned}
$$

The functions in ( $V^{\prime \prime}$ ) become:

$$
\begin{aligned}
& v_{1}=\operatorname{xyuw}\left[z w+\frac{\delta}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{2}=x z u w\left[z w+\frac{\delta}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{3}=\operatorname{xyzuw}\left[w+\frac{\lambda_{2} t}{r k}(z-y)\right] D_{1}^{-1} \\
& v_{4}=\operatorname{xyzuw}[w+v(z-y)] D_{2}^{-1} \\
& v_{5}=-2 x y z u w\left[\frac{z-y}{m r}\right] D_{1}^{-1} \\
& v_{6}=-2 x y z u w\left[\frac{z-y}{m r}\right] D_{2}^{-1} \\
& v_{7}=\operatorname{xyzu}\left[z w+\frac{\delta}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{8}=\operatorname{yzuw}\left[z w+\frac{\delta}{r k}(z-y)(y-w)\right] D^{-1} \\
& v_{9}=\operatorname{xyzuw}\left[y-\frac{\left(r-\lambda_{1}\right)}{r k}(z-y)\right] D_{2}^{-1} \\
& v_{10}=\operatorname{xyzuw}\left[y-\frac{r k-\lambda_{2} t}{r k}(z-y)\right] D_{1}^{-1}
\end{aligned}
$$

where $D_{1}$ and $D_{2}$ are the same as $D$ defined for singular and semiregular GD-PBIB Designs, respectively. D in this section can take value $D_{1}$ or $D_{2}$ as $\delta$ takes the values $\lambda_{2} t$ or $k v$, respectively.

Observe that the term $\mathrm{xy}^{2}$ uw $^{2}$ appears only in $v_{1}, x^{2}{ }^{2} u^{2}{ }^{2}$ appears only in $v_{2}, x y^{2} z^{2} u$ appears only in $v_{7}$, and $y z^{2} u{ }^{2}{ }^{2}$ appears only in $v_{8}$. This implies $v_{1}, v_{2}, v_{7}$, and $v_{8}$ are mutually linearly independent of $v_{3}, v_{4}, v_{5}, v_{6}, v_{9}, v_{10}$. Now observe that after removing the common factor xyzuw in $v_{3}, v_{4}, v_{5}, v_{6}, v_{9}$, and $v_{10}$, these are also linearly independent, thereby proving that (IV' ${ }^{\prime}$ ) is not true unless $a_{1}, a_{2}, \ldots, a_{11}$ and $c$ vanish. This condition then implies the set of sufficient statistics defined in (IV'') are minimal.

Hence from the above discussions we have the following theorem and corollaries.

Theorem 4: Under the assumption of an Eisenhart Model II in a regular group divisible, partially balanced incomplete block design with two associate classes, there are ten statistics in a minimal set
of sufficient statistics if $b>t$ and nine statistics in a minimal set
if $\mathrm{b}=\mathrm{t}$.
Corollary 4.1. A set of minimal sufficient statistics for a regular, group divisible, partially balanced incomplete block design is as
follows:
$s_{1}=y \ldots$
$s_{2}=(\mathrm{mk})^{-1} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{P}_{21} \mathrm{P}^{\prime}{ }_{21} \mathrm{X}_{1}^{\prime} \mathrm{Y} \quad$ if $\mathrm{b}>\mathrm{t}$, not defined if $\mathrm{b}=\mathrm{t}$.
$s_{3}=(m k)^{-1} Y^{\prime} X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime} Y$ or $\left[m^{2} k\left(r k-\lambda_{2} t\right)\right]^{-1} Y^{\prime} X_{1} N^{\prime} P_{31} P_{31}^{\prime} N_{1}^{\prime} Y$

$$
\begin{aligned}
& s_{4}=(m k)^{-1} Y^{\prime} X_{1} P_{23} P^{\prime}{ }_{23} X_{1}^{\prime} Y \text { or }\left[m^{2} k\left(r-\lambda_{1}\right)\right]^{-1} Y^{\prime} X_{1} N^{\prime} P_{32} P_{32}^{\prime} N X_{1}^{\prime} Y \\
& s_{5}=\frac{k}{\lambda_{2}{ }^{t m}} Y^{\prime} A P_{31} P_{31}^{\prime} A^{\prime} Y \\
& \mathrm{~s}_{6}=(\mathrm{mv})^{-1} \mathrm{Y}^{\prime} \mathrm{AP}_{32} \mathrm{P}_{32}^{\prime} \mathrm{A}^{\prime} \mathrm{Y} \\
& s_{7}=m^{-1} \mathrm{Y}^{\mathrm{T}} \mathrm{PP}_{4} \mathrm{P}_{4} \mathrm{~F}^{\mathrm{i} Y} \\
& s_{8}=Y^{4} P_{5} P_{5}^{t} Y \\
& s_{9}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{22^{\prime}} P_{31}^{\prime} A^{\prime} Y \\
& s_{10}=\left[k^{-2}\left(r-\lambda_{1}\right)\right] \mathrm{YX}_{1} \mathrm{P}_{23} \mathrm{P}_{32}^{\prime} \mathrm{A}^{\prime} \mathrm{Y}
\end{aligned}
$$

Corollary 4.2. The distributions of the ten statistics as defined in
Corollary 4.1 are as follows:
$s_{1} \sim N\left[\mu,(b k m)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]$
$s_{2} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] X_{(b-t)}^{2} \quad$ if $b>t$, not defined if $b=t$
$s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] x_{(g-1)}^{2}$
$\left.s_{4} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] x_{[g(n-1)}^{2}\right]$
$s_{5} \sim\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right] x_{(g-1)}^{2}$
$s_{6} \sim\left[\sigma^{2}+m v \sigma_{2}^{2}\right] x_{[g(n-1)]}^{2}$
$s_{7} \sim\left[\sigma^{2}+m \sigma_{3}^{2}\right] x_{[b k-b-t+1]}^{2}$
$s_{8} \sim \sigma^{2} X_{b k(m-1)}^{2}$
$s_{9} \sim \Sigma_{a_{i}} X_{(1)}^{2}$ where $a_{i}$ are the non-zero characteristic roots

$$
\text { of } 2^{-1}\left(A_{1}+A_{1}\right) \nexists \text { where } A_{1}=k^{-1} X_{1} N^{\prime} P_{31} P_{31}^{t} A^{\prime} \text {. }
$$

$s_{10} \sim \mathbb{\Sigma} b_{i} X_{(1)}^{2}$ where $b_{i}$ are the non-zero characteristic roots of $2^{-1}\left(B_{1}+B_{1}^{\prime}\right) \not Z$ where $B_{1}=k^{-1} X_{1} N^{\prime} P_{32} P_{32}^{\prime} A^{\prime}$.

For proof see Appendix III.
Corollary 4.3. The ten statistics as defined in Corollary 4.1 are pairwise independent except for the pairs $\left(s_{3}, s_{5}\right),\left(s_{3}, s_{9}\right),\left(s_{4}, s_{6}\right)$, $\left(s_{4}, s_{10}\right),\left(s_{5}, s_{9}\right)$, and $\left(s_{6}, s_{10}\right)$.

For proof see Appendix IV.
Corollary 4.3. The expectations of the ten statistics as defined in

## Corollary 4.1 are as follows:

$$
\begin{aligned}
& E\left(s_{1}\right)=\mu \\
& E\left(s_{2}\right)=(b-t)\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) \quad \text { if } b>t, \text { not defined if } b=t . \\
& E\left(s_{3}\right)=(g-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{4}\right)=g(n-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{5}\right)=(g-1)\left[\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right] \\
& E\left(s_{6}\right)=g(n-1)\left[\sigma^{2}+m v \sigma_{2}^{2}\right] \\
& E\left(s_{7}\right)=(b k-b-t+1)\left[\sigma^{2}+m \sigma_{3}^{2}\right] \\
& E\left(s_{8}\right)=b k(m-1) \sigma^{2} \\
& E\left(s_{9}\right)=m k^{2}-2 \lambda_{2} t\left(r k-\lambda_{2} t\right) \sigma^{2}(g-1) \\
& E\left(s_{10}\right)=g(n-1) m^{3}\left(r-\lambda_{1}\right)\left(r k-r+\lambda_{1}\right) k^{-2} \sigma_{2}^{2}
\end{aligned}
$$

For proof of this corollary see Appendix III.

& p_{56}=m^{-1 / 2} P_{4}^{1} F^{\prime} P_{5}=\phi
\end{aligned}
$$

Hence $P P^{\prime}=I_{b k m}$ and therefore $P^{\prime}$ is an orthogonal matrix.
To show $\mathrm{P}^{\mathrm{t}}$ is an orthogonal matrix for each of the three types of GD-PBIB designs, let $P^{\prime}$ be transferred to the following form after combining the partitions of $Q_{2}$ and $Q_{3}$.

$$
P=\left[\begin{array}{l}

& A_{55}=(m v)^{-1} P_{32}^{1} A^{\prime} \ngtr / A P_{32} \\
& =(\mathrm{mv})^{-1} \mathrm{P}_{32}^{1}\left[\left(\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{1}\right) \sigma_{2}^{2}+\mathrm{m}\left(\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN} \mathrm{~N}^{1}\right) \sigma_{3}^{2}\right. \\
& \left.+\left(\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{2}\right) \sigma^{2}\right] \mathrm{P}_{32} \\
& =(m v)^{-1}\left[m^{2} v^{2} \sigma_{2}^{2}+m^{2} v \sigma_{3}^{2}+m v \sigma^{2}\right] I_{g(n-1)} \\
& =\left[m v \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] I_{g(n-1)} .
\end{aligned}
$$

The derivation of P'ZP for R-GD-PBIB Designs: This follows from the results derived for $P 1 \notin P$ in the case of $B I B, S-G D-P B T B$, and SR-GD-PBIB designs.

## APPENDIX III

DISTRIBUTIONS AND EXPECTATIONS OF THE $s_{i}$

In this appendix we shall find the distributions and expectations of each of the statistics in the minimal sets of sufficient statistics that we have found for the BIB and GD-BIB designs.

We shall first state a well-known theorem which we shall use in deriving the distribution of each statistic.

Theorem: If $Y$ is distributed as the multivariate normal, mean $\bar{\mu}$ and
covariance matrix $\mathbb{Z}$, then $Y^{\prime} A Y$ is distributed as the non-central
$X^{2}$ with degrees of freedom $k$ and non-centrality parameter $\lambda$ if $A \not Z$
is idempotent and where $k$ is the rank of $A$ and $\lambda=2^{-1} \bar{\mu} \cdot A \bar{\mu}[3]$.

1. $s_{1}=y \ldots$

Since y... is a linear combination of normal variables y... is distributed normally, mean $\mu$ and variance $(b \mathrm{~km})^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}\right.$ $\left.+m \sigma_{3}^{2}\right)$ or $s_{1} \sim N\left[\mu,(b k m)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right.$.
2. $s_{2}=(k m)^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime Y}$

Distribution of $s_{2} . \quad$ Let $A_{2}=(k m)^{-1} X_{2} P_{21} P_{21}^{l} X_{1}^{t} . \quad$ Then $A_{2} A_{2}=A_{2}$.
In order to apply the theorem we must show that:

$$
\mathrm{A}_{2} \not Z \mathrm{~A}_{2} \not \square=\mathrm{A}_{2} \not Z
$$

or equivalently

$$
A_{2} \not{ }^{\not Z} A_{2}=A_{2} .
$$

Let $B_{2}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)^{-1} A_{2}$. Then $Y^{\prime} B_{2} Y \sim X^{\prime 2}\left(k_{2}, \lambda_{2}\right)$, where $k_{2}=\operatorname{rank} B_{2}=\operatorname{rank} A_{2}=\operatorname{tr} A_{2}=(k m)^{-1} \operatorname{Tr},\left(X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\right)=\operatorname{tr} P_{21} P_{21}^{\prime}=b-t$.

$$
\lambda_{2}=\mu^{2} J_{b k m}^{1} X_{1} P_{21} P_{21}^{1} X_{1}^{1 J_{1}^{b k m}}\left(\sigma^{2}+k \sigma_{1}^{2}\right)^{-1}=\phi
$$

Therefore $s_{2} \sim\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) \chi_{b-t}^{2}$. Therefore, $E\left(s_{2}\right)=(b-t)\left(\sigma^{2}\right.$ $+m k \sigma_{1}^{2}+m \sigma_{3}^{2}$.

$$
\text { 3. } s_{3}=(k m)^{-1} Y^{\prime} X_{1} P_{22^{\prime}} P_{22}^{\prime} X_{1}^{\prime}
$$

Let $A_{3}=(k m)^{-1} X_{1} P_{22} P_{22}^{\prime} X_{1}^{!} . \quad A_{3} A_{3}=A_{3}$.

$$
\mathrm{A}_{3} \not \approx \mathrm{~A}_{3}=(\mathrm{km})^{-2} \mathrm{X}_{1} \mathrm{P}_{22} \mathrm{P}_{22}^{1} \mathrm{X}_{1}^{1}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{1} \sigma_{1}^{2}+\mathrm{X}_{2} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{1} \sigma_{3}^{2}\right.
$$

$$
\left.+\sigma^{2} I\right] X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime}
$$

$$
=(k m)^{-2} X_{1} P_{22} P_{22}^{1}\left[m^{2} k^{2} \sigma_{1}^{2}+N^{i} N \sigma_{2}^{2}+m^{2} k \sigma_{3}^{2}+m k \sigma^{2}\right] P_{22} P_{22}^{1} X_{1}^{1}
$$

$$
=(k m)^{-1} X_{1} \dot{P}_{22} P_{22}^{\prime}\left[m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] P_{22} P_{22}^{\prime} X_{1}^{\prime}
$$

$$
=(k m)^{-1} X_{1} P_{22} P_{22}^{\prime} X_{1}^{\prime}\left[m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right]
$$

Let $B_{3}=\left[m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right]^{-1} A_{3}$.

$$
\begin{aligned}
& A_{2} \not{ }^{\prime} A_{2}=(m k)^{-2} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\left(X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{\prime} \sigma_{2}^{2}+X_{3} X_{3}^{1} \sigma_{3}^{2}\right. \\
& +\sigma^{2} I_{1} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} \\
& =(m k)^{-2} X_{1} P_{21} P_{21}^{\prime}\left(m^{2} k^{2} \sigma_{1}^{2}+N N \sigma_{2}^{2}+m^{2} k \sigma_{3}^{2}+m k \sigma^{2} I\right) P_{21} P_{21}^{i} X_{1}^{\prime} \\
& =(m k)^{-1} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\left[\sigma_{1}^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] \\
& =\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) A_{2}
\end{aligned}
$$

$Y^{1} B_{3} Y \sim X^{3^{2}}\left(k_{3}, \lambda_{3}\right)$, where $k_{3}=$ rank of $B_{3}=r a n k$ of $A_{3}=\operatorname{tr} A_{3}=$ $(\mathrm{mk})^{-1} \operatorname{tr}\left(\mathrm{X}_{1} \mathrm{P}_{22} \mathrm{P}_{22}^{\mathbf{1}} \mathrm{X}_{1}^{\prime}\right)=\mathrm{t}-1 . \quad \lambda_{3}=\mu^{2} \mathrm{~J}_{\mathrm{bkm}}^{1} \mathrm{X}_{1} \mathrm{P}_{22} \mathrm{P}_{22}^{\prime} \mathrm{J}_{1}^{\mathrm{bkm}}=0$. Therefore

$$
s_{3} \sim\left[m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] X_{t-1}^{2}
$$

and

$$
E\left(s_{3}\right)=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}(r-\lambda) \sigma_{2}^{2}+m \sigma_{3}^{2}\right](t-1)
$$

4. $\quad \mathrm{A}_{5}=\frac{k}{\lambda t \mathrm{~m}} \mathrm{AP}_{3} \mathrm{P}_{3}^{1} \mathrm{~A}^{\mathrm{t}}$

Then $A_{5} A_{5}=A_{5}$.

$$
\begin{aligned}
A_{5} \not Z^{\prime} A_{5}= & \frac{k^{2}}{\lambda^{2} t^{2} m^{2}} A P_{3} P_{3}^{\prime} A^{\prime}\left(X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{\prime} \sigma_{2}^{2}\right.
\end{aligned} \begin{aligned}
& X_{3} X_{3}^{1} \sigma_{3}^{2} \\
& \left.+\sigma^{2} I\right) A P_{3} P_{3}^{\prime} A^{\prime} \\
= & \frac{k^{2}}{\lambda^{2} t_{m}^{2}} A P_{3} P_{3}^{\prime}\left[\left(\lambda k^{-1} m\right)^{2}(t I-J)(t I-J) \sigma_{2}^{2}+\left(m^{2}{ }_{r I}-k^{-1} N N^{\prime}\right) \sigma_{3}^{2}\right. \\
& \left.+\lambda k^{-1} m(t I-J) \sigma^{2}\right] P_{3} P_{3}^{\prime} A \\
= & \frac{k}{\lambda t m} A P_{3} P_{3}^{\prime} A^{\prime} \sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+\left[\frac{m r t}{\lambda t}-\frac{m(x-\lambda)}{\lambda t}\right] \sigma_{3}^{2} \\
= & \frac{k}{\lambda t m} A P_{3} P_{3}^{\prime} A^{\prime}\left[\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right]
\end{aligned}
$$

Let $B_{5}=\left(\sigma^{2}+\lambda k^{-1} \operatorname{mt} \sigma_{2}^{2}+m \sigma_{3}^{2}\right)^{-1} A_{5} . \quad$ Then $Y^{\prime} B_{5} Y \sim X^{2}\left(k_{5}, \lambda_{5}\right)$, where $k_{5}=$ rank of $B_{5}=$ rank of $A_{5}=\operatorname{tr} A_{5}$

$$
\begin{aligned}
& =\frac{k}{\lambda t m} \operatorname{tr} A P_{3} P_{3}^{\prime} A^{\prime} \\
& =\frac{k}{\lambda t m} \operatorname{tr} A^{\prime} A P_{3} P_{3}^{1} \\
& =\frac{k}{\lambda t m} \operatorname{tr}\left[\lambda k^{-1} m(t I-J) P_{3} P_{3}^{\prime}\right]=t r P_{3} P_{3}^{\prime}=t-1
\end{aligned}
$$

$$
\lambda_{5}=\mu^{2} \mathrm{~J}_{\mathrm{bkm}}^{1} \mathrm{AP}_{3} \mathrm{P}_{3}^{\prime} \mathrm{A}^{\prime} \mathrm{J}_{1}^{\mathrm{bkm}}=0
$$

Therefore

$$
s_{5} \sim\left[\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \quad x_{t-1}^{2}
$$

and

$$
E\left(s_{5}\right)=(t-1)\left(\sigma^{2}+\lambda k^{-1} m t \sigma_{2}^{2}+m \sigma_{3}^{2}\right)
$$

5. Distribution and expectation of $s_{6}=m^{-1} Y^{i} \mathrm{FP}_{4} \mathrm{P}_{4}^{\mathbf{1}} \mathrm{F}^{\mathrm{I}} \mathrm{Y}$

Let $A_{6}=m^{-1} \mathrm{FP}_{4} P_{4}^{1} F^{\prime}$. Then

$$
A_{6} A_{6}=m^{-2} F P_{4} P_{4}^{i} F^{\prime} F P_{4} P_{4}^{\prime} F^{\prime}
$$

$$
=\mathrm{m}^{-1} \mathrm{FP}_{4} \mathrm{P}_{4}^{\prime} \mathrm{m}^{-1} \mathrm{FF}^{\prime} \mathrm{P}_{4} \mathrm{P}_{4}^{\prime} \mathrm{F}^{\prime}
$$

$$
=m^{-1} F P_{4} P_{4}^{1} F^{\prime}
$$

$$
\left[\left(\mathrm{P}_{4}^{\prime} \mathrm{m}^{-1} \mathrm{~F}^{\prime} \mathrm{P}_{4}=\mathrm{I}_{\mathrm{bk}-\mathrm{b}-\mathrm{tt-1}}\right]\right.
$$

$$
=A_{6}
$$

$$
\left(F^{\prime} X_{3}=E\right)
$$

$$
=\mathrm{m}^{-1} F P_{4} P_{4}^{\mathrm{t}} \mathrm{~F}^{\mathrm{t}}\left[\mathrm{~m} \mathrm{\sigma}_{3}^{2}+\sigma^{2}\right]
$$

Therefore,

$$
s_{6} \sim\left(\sigma^{2}+m \sigma_{3}^{2}\right) x_{b k-b-t+1}^{2}
$$

$$
\begin{aligned}
& A_{6} \not Z^{\prime} A_{6}=m^{-2} F P_{4} P_{4}^{1} F\left[X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{1} \sigma_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}+\sigma^{2}\right] F P_{4} P_{4}^{1} F^{\prime} \\
& =m^{-2} F P_{4}\left[P_{4}^{t} F{ }^{i} X_{3} X_{3}^{i} F P_{4}{ }_{3}^{2}+P_{4}^{t} F^{i} F P_{4} \sigma^{2}\right] P_{4}^{i} F^{\prime} \\
& =\mathrm{m}^{-1} \mathrm{FP} \mathrm{P}_{4}\left[\mathrm{P}_{4}^{\prime} \mathrm{m}^{-1} E \mathrm{~m}^{-1} E P_{4} \mathrm{~m} \mathrm{\sigma}_{3}^{2}+\mathrm{P}_{4}^{\prime} \mathrm{m}^{-1} E P_{4} \sigma^{2}\right] \mathrm{P}_{4}^{i} \mathrm{~F}^{\prime}
\end{aligned}
$$

$$
\begin{aligned}
& \lambda_{6}=\mu^{2} J_{b k m}^{1} P_{4}^{1} P_{4}^{1} F^{1} J_{1}^{b k m}=0 \\
& E\left(s_{6}\right)=\left(\sigma^{2}+m \sigma_{3}^{2}\right)(b k-b-t+1)
\end{aligned}
$$

Let $A_{7}=P_{5} P_{5}^{\mathbf{1}} . \quad$ Then $A_{7} A_{7}^{\prime}=A_{7}$.

$$
\mathrm{A}_{7} \nsucceq \mathrm{~A}_{7}=\mathrm{P}_{5} \mathrm{P}_{5}^{\mathbf{1}}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{1} \sigma_{1}^{2}+\mathrm{X}_{2} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{1} \sigma_{3}^{2}+\sigma^{2} \mathrm{I}\right] \mathrm{P}_{5} \mathrm{P}_{5}^{\prime}=\sigma^{2} \mathrm{~A}_{7}
$$

Let $B_{7}=\sigma^{-2} A_{7}$. Then $Y^{1^{\prime}} B_{6} Y \sim X^{1^{2}}\left(k_{7}, \lambda_{7}\right)$, where $k_{7}=$ rank of $B_{7}$ $=$ rank of $A_{7}=\operatorname{tr} P_{5} P_{5}^{\prime}=\operatorname{tr} I_{b k m-b k}=b k(m-I)$.

$$
\lambda_{7}=\mu^{2} J_{b k m}^{l} P_{5} P_{5}^{1} J_{l}^{b k m}=0
$$

Therefore

$$
\begin{aligned}
& s_{7} \sim \sigma^{2} x_{b k m-b k}^{2} \\
& E\left(s_{7}\right)=(b k m-b k) \sigma^{2}
\end{aligned}
$$

Now $s_{4}=k^{-1}(r-\lambda)^{1 / 2} Y^{\prime} X_{1} P_{22^{\prime}} P_{3}^{1} A^{\prime} Y=k^{-1} \mathrm{~m}^{-1} \mathrm{Y}^{1} \mathrm{X}_{1} \mathrm{~N}^{t} \mathrm{P}_{3} \mathrm{P}_{3}^{1} \mathrm{~A}^{\prime} \mathrm{Y}$. Let $A_{4}=k^{-1} m^{-1} X_{1} N^{i} P_{3} P_{3}^{1} A^{t}$. Since $A_{4}$ is not symmetric, we may write

$$
Y^{\prime} A_{4} Y=2^{-1} Y^{\prime}\left[A_{4}+A_{4}^{i}\right] Y
$$

Then since $4^{-1}\left(A_{4}+A_{4}^{1}\right) \nVdash\left(A_{4}+A_{4}^{1}\right)$ is not equal to $2^{-1}\left(A_{4}+A_{4}^{1}\right), s_{4}^{\text {is }}$ not distributed as $X^{2}$ variate but as a linear combination of $X^{2}$ variates. That is,

$$
s_{4} \sim \Sigma a_{i j} x_{(1)}^{2}
$$

where $a_{i}$ are the non-zero characteristic roots of $2^{-1}\left(A_{4}+A_{4}^{1}\right)$.

$$
\begin{aligned}
& E\left(s_{4}\right)=E\left[k^{-1} m^{-1} Y^{\prime} X_{1} N P_{3} P_{3}^{\prime} A^{\prime} Y\right] \\
& =E \operatorname{tr}\left[k^{-1} \mathrm{~m}^{-1} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{~N}^{t} \mathrm{P}_{3} \mathrm{P}_{3}^{1} \mathrm{~A}^{\prime} \mathrm{Y}\right] \\
& =k^{-1} m^{-1} \operatorname{tr} E\left[Y Y^{t} X_{1} N^{t} P_{3} P_{3}^{t} A^{t}\right] \\
& =\mathrm{k}^{-1} \mathrm{~m}^{-1} \operatorname{tr}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{t} \sigma_{1}^{2}+\mathrm{X}_{2}^{1} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{t} \sigma_{3}^{2}+\sigma^{2} \mathrm{I}\right] \mathrm{X}_{1} \mathrm{~N}^{t} \mathrm{P}_{3} \mathrm{P}_{3}^{t} \mathrm{~A}^{t} \\
& =k^{-1} m^{-1} \operatorname{tr}\left[A^{\prime} X_{2} X_{2}^{t} X_{1} N^{t} P_{3} P_{3}^{1} \sigma_{2}^{2}+A^{t} X_{3} X_{3}^{1} X_{1} N^{t} P_{3} P_{3}^{t} \sigma_{3}^{2}\right] \\
& =k^{-1} \mathrm{~m}^{-1} \operatorname{tr} \mathrm{P}_{3}^{1}\left[\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{\mathrm{t}}\right] \mathrm{NN}^{\mathrm{t}} \mathrm{P}_{3} \sigma_{2}^{2} \\
& =k^{-1} m^{-1}\left[\operatorname{mrm}^{2}(r-\lambda)-m^{-1} k^{-1} m^{4}(r-\lambda)^{2}\right] \operatorname{tr} I_{t-1} \sigma_{2}^{2} \\
& =k^{-1} m^{2}(r-\lambda)\left[r-\frac{r-\lambda}{k}\right] \operatorname{tr} I_{t-1} \sigma_{2}^{2} \\
& =k^{-1} m^{2}(r-\lambda)\left[\frac{r(k-1)}{k}+\frac{\lambda}{k}\right] \operatorname{trI} t-\sigma_{2}{ }_{2}^{2} \\
& =k^{2} m^{2}(r-\lambda) \lambda t \sigma_{2}^{2} \operatorname{tr} I_{t-1} \\
& =k^{-2} m^{2}(r-\lambda) \lambda t \sigma_{2}^{2}(t-1)
\end{aligned}
$$

6. $s_{4}=m^{-1} k^{-1} Y^{\prime} X_{1} N^{t} P_{3} P_{3}^{1} A^{\prime} Y$.

Substituting ( $I-t^{-1} J$ ) for $P_{3} P_{3}^{1}$, we have $s_{4}=m^{-1} k^{-1} Y^{t} X_{1} N^{\prime \prime Z}-$ $\left.t^{-1} J\right) A^{\prime} Y=m^{-1} k^{-1} Y^{\prime} X_{1} N^{\prime} A^{\prime} Y . \quad\left(P_{3} P_{3}^{t}=I-t^{-1} J\right.$ because corresponding to a unique characteristic root $\mathrm{m}^{2} \mathrm{rk}$ of $\mathrm{NN}^{\text { }}$, we have a unique vector $(1 / \sqrt{t}, 1 / f t, \ldots, 1 / \sqrt{t})$ from the orthogonal $t \times t$ matrix which diagonalizes $N^{1}$ ). Since the $j$-th element of $Y^{1} X_{1} N^{1}$ is $T_{j}$ and the $j$-th element of $A^{\prime} Y$ is $Q_{j}$, this statistic may be written as $m^{-1} k^{-1} \Sigma T_{j} Q_{j}$.
7. In order to determine $s_{2}$ in terms of the block and treatment totals, consider

$$
\begin{aligned}
m^{-1} k^{-1} X_{1} X_{1}^{\prime} Y & =m^{-1} k^{-1} Y^{\prime} X_{1}\left(P_{2} P_{2}^{\prime}\right) X_{1}^{\prime} Y \\
& =m^{-1} k^{-1} Y^{\prime} X_{1}\left(P_{20}, P_{21}, P_{22}\right)\left[\begin{array}{c}
P_{20}^{\prime} \\
P_{21}^{\prime} \\
P_{22}^{\prime}
\end{array}\right] X_{1}^{\prime Y}
\end{aligned}
$$

We can write $P_{20} P_{20}^{\prime}=b^{-1} J_{b}^{b}$. This follows from the reason given for $P_{3} P_{3}^{1}$ in 6. above. Since $b^{-1} J_{b}^{1} N^{l} N J_{1}^{b}=m^{2} r_{t b}^{-1}=m^{2} r k$, which is a characteristic root of $N^{l} N$ of multiplicity 1 , we therefore write:

$$
\begin{aligned}
m^{-1} k^{-1} Y X_{1} X_{1}^{\prime} Y-(m b k)^{-1} Y Y^{\prime} X_{1} J X_{1}^{\prime} Y & -m^{-1} k^{-1} Y^{\prime} X_{1} P_{22^{P}}{ }_{22^{\prime}} X_{1}^{\prime} Y \\
& =m^{-1} k^{-1} Y^{\prime} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} Y
\end{aligned}
$$

or writing this in terms of block and treatment totals we have
where $B_{i}$ is the i-th element of $X_{1}^{\prime Y}$ and $B .=b^{-1} \Sigma B_{i}$. The statistics $s_{2}$ may be obtained then by subtracting $s_{3}$ from the corrected sum of squares of blocks.

Singular, Group Divisible, PBIB Designs.
In this section we shall find the distributions and expectations of the statistics in a minimal set of sufficient statistics for singular GD PBIB Designs.

1. Distribution of $s_{1}=y .$.

Since $s_{1}$ is a linear combination of normal variables, $s_{1}$ is normally distributed with mean $E(y .)=.\mu$ and variance $E\left(y . . .-\mu^{2}\right)=(b k m)^{-1}\left(\sigma^{2}\right.$ $\left.+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)$. That is

$$
\mathrm{s}_{1} \sim \mathrm{~N}\left[\mu,(\mathrm{bkm})^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]
$$

2. Distribution of $s_{2}=(m k)^{-1} Y{ }^{\prime} X_{1} P_{21} P^{1}{ }_{21} X_{1}^{\prime} Y$.

Let

$$
A_{1}=(m k)^{-1} X_{1} P_{21} P_{21}^{1} X_{1}^{1}
$$

then

$$
\begin{aligned}
A_{1} A_{1} & =(m k)^{-2} X_{1} P_{21} P_{21}^{t} X_{1}^{!} X_{1}^{t} P_{21} P_{21}^{t} X_{1}^{1} \\
& =(m k)^{-1} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}=A_{1}
\end{aligned}
$$

and

$$
\begin{aligned}
& A_{1} \not Z^{\prime} A_{1}=(m k)^{-2} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\left[X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{\mathbf{1}}{ }_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}\right. \\
& \left.+\omega^{2}{ }_{1}\right] X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} \\
& =(m k)^{-2} X_{1} P_{21} P_{21}^{\prime}\left[m^{2} k^{2} \sigma_{1}^{2} I_{b}+N^{1} N^{2} \sigma_{2}^{2}+M M^{\prime} \sigma_{3}^{2}\right. \\
& \left.+m k \sigma^{2} I_{b}\right] P_{21} P_{21}^{\prime} X_{1}^{\prime}
\end{aligned}
$$

$$
\begin{aligned}
& \left.+m k \sigma^{2} I_{b}\right] P_{21} P_{21}^{i} X_{1}^{i} \\
& =(m k)^{-1} X_{1} P_{21} P_{21}^{1} X_{1}^{\prime}\left[m k \sigma_{1}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] \\
& =\left[m k \sigma_{1}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] A_{1}
\end{aligned}
$$

Let $B_{1}=\left[m k \sigma_{1}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right]^{-1} A_{1}$. Therefore $Y^{2} B_{2} Y \sim X^{\prime 2}\left(k_{1}, \lambda_{1}\right)$, where $k_{1}=$ rank of $B_{1}=$ rank of $A_{1}=\operatorname{tr} A_{1}=(m k)^{-1} \operatorname{tr} X_{1} P_{21} P_{21}^{\prime} X_{1}^{t}=b-g$.

$$
\lambda_{1}=\mu^{2} J_{b k m}^{1} X_{1} P_{21} P_{21}^{1} X_{1}^{1} J_{1}^{b k m} C(\sigma)=0
$$

Hence

$$
\begin{gathered}
s_{2} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] \chi_{b \sim g}^{2} \\
E\left(s_{2}\right)=(b-g)\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]
\end{gathered}
$$

3. Distribution of $s_{3}=(k m)^{-1} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{P}_{22}^{\prime} \mathrm{P}_{22} \mathrm{X}_{1}^{\prime \mathrm{Y}}$

Let

$$
A_{2}=(k m)^{-1} X_{1} P_{22}^{\prime} P_{22} X_{1}
$$

Then

$$
A_{2} A_{2}=A_{2}
$$

and

$$
\begin{aligned}
& A_{2} \not Z^{\prime} A_{2}=(m k)^{-2} X_{1} P_{22} P_{22}^{\prime} X_{1}^{!}\left[X_{1} X_{1}^{\jmath_{1}}{ }_{1}^{2}+X_{2} X_{2}^{\prime}{ }_{2}^{2}+X_{3} X_{3}^{\prime}{ }_{3}^{2}\right. \\
& \left.+\sigma^{2}\right]_{1} P_{22} P_{22}^{\prime} X_{1}^{3} \\
& =(m k)^{-1} X_{1} P_{22} P_{22}^{\prime}\left[\left(m k \sigma_{1}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right) I_{b}\right. \\
& \left.+\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{i} \sigma_{2}^{2}\right] \mathrm{P}_{22} \mathrm{P}_{22}^{2} \mathrm{X}_{1}^{1} \\
& =(m k)^{-1} X_{1} P_{22}\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right] P_{22}^{1} X_{1}^{1} \\
& =\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right] A_{2}
\end{aligned}
$$

Let $B_{2}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right]^{-1} A_{2}$. Then $Y^{1} B_{2} Y \sim$ $x^{t^{2}}\left(k_{2}, \lambda_{2}\right)$ where $k_{2}=$ rank of $B_{2}=$ rank of $A_{2}=\operatorname{tr} A_{2}$

$$
=\operatorname{tr}(\mathrm{mk})^{-1} \mathrm{X}_{1} P_{22^{2}} \mathrm{P}_{22}^{\prime} X_{1}^{t}=g-1
$$

and

$$
\lambda_{3}=\mu^{2} J_{b k m}^{1} X_{1} P_{22} P_{22}^{\mathrm{t}} J_{1}^{\mathrm{bkm}} C(\sigma)=0
$$

Hence

$$
\begin{aligned}
& s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right] \chi_{g-1}^{2} \\
& E\left(s_{3}\right)=(g-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}+m k^{-1}\left(r k-\lambda_{2} t\right) \sigma_{2}^{2}\right]
\end{aligned}
$$

4. Distribution of $s_{4}=\left(\frac{k}{\lambda_{2}{ }^{t m}}\right) Y^{t} A P_{31} P P_{31}^{1} A^{\prime} Y$.

Let

$$
A_{3}=\left(\frac{k}{\lambda_{2} \mathrm{tm}}\right) A P_{31} P_{31}^{2} A^{s} .
$$

Then

$$
A_{3} A_{3}=A_{3}
$$

and

$$
\begin{aligned}
& A_{3} \not Z^{\prime} A_{3}=\left(\frac{k}{\lambda_{2} t m}\right)^{2} A P_{31} P_{31}^{\prime} A^{\prime}\left[X_{1} X_{1}^{t} \sigma_{1}^{2}+X_{2} X_{2}^{1} \sigma_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}\right. \\
& \left.+\sigma^{2} I\right] \mathrm{AP}_{31} \mathrm{P}_{31}^{\mathrm{t}} \mathrm{~A}^{2} \\
& =\left(\frac{\mathrm{k}}{\lambda_{2}{ }^{t m}}\right)^{2} \mathrm{AP}_{31^{-1}} \mathrm{P}_{31}^{1}\left[\left(\mathrm{mrIm} \mathrm{~m}^{-1} \mathrm{k}^{-1} \mathrm{NN} N^{\prime}\right)\left(\mathrm{mr}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{2}\right) \sigma_{2}^{2}\right. \\
& \left.+\left(\mathrm{mrI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{1}\right) \sigma^{2}\right] \mathrm{P}_{31} \mathrm{P}_{31}^{i} \mathrm{~A}^{\prime} \\
& =\frac{k}{\lambda_{2} \operatorname{tm}}\left(\sigma^{2}+m k^{-1} \lambda_{2} \operatorname{t\sigma }_{2}^{2}\right) A_{3}
\end{aligned}
$$

Let $B_{3}=\left(\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right)^{-1} A_{3}$. Then $Y^{\prime} B_{3} Y \sim x^{\prime 2}\left(k_{3}, \lambda_{3}\right)$, where $k_{3}=$ rank of $B_{3}=$ rank of $A_{3}=\operatorname{tr} A_{3}=\frac{k}{\lambda_{2} \operatorname{tm}} \operatorname{tr} A P_{31} P_{31}^{\prime} A^{\prime}=g-1$, and

$$
\lambda_{4}=\mu^{2} J_{b k m}^{1} A P_{31} P_{31}^{1} A^{\prime} C(\sigma)=0
$$

Hence

$$
\begin{aligned}
& s_{4} \sim\left(\sigma^{2}+m k^{-1} \lambda_{2}{ }^{t \sigma_{2}^{2}}\right) x_{g-1}^{2} \\
& E\left(s_{4}\right)=(g-1)\left(\sigma^{2}+m k^{-1} \lambda_{2} t \sigma_{2}^{2}\right)
\end{aligned}
$$

5. Distribution of $s_{5}=(\mathrm{rm})^{-1} \mathrm{Y}^{\prime} A P_{32^{\prime}} \mathrm{P}_{32}^{\mathrm{A}} \mathrm{A}^{\mathrm{I}} \mathrm{Y}$. Let

$$
A_{4}=(r m)^{-1} A P_{32} P_{32}^{1} A^{\prime} .
$$

Then

$$
\mathrm{A}_{4} \mathrm{~A}_{4}=\mathrm{A}_{4}
$$

and

$$
\begin{aligned}
\mathrm{A}_{4} \not Z \mathrm{~A}_{4}= & (\mathrm{rm})^{-2} \mathrm{AP}_{32} \mathrm{P}_{32}^{1} \mathrm{~A}^{t}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{1} \sigma_{1}^{2}\right.
\end{aligned}+\mathrm{X}_{2} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{1} \sigma_{3}^{2} .
$$

Let $B_{4}=\left(\sigma^{2}+\operatorname{mr} \sigma_{2}^{2}\right)^{-1} A_{4}$. Then $Y^{\prime} B_{4} Y \sim X^{\prime}{ }^{2}\left(k_{4}, \lambda_{4}\right)$, where $k_{4}=$ rank of $B_{4}=$ rank of $A_{4}=\operatorname{tr} A_{4}=\operatorname{tr}(m r)^{-1} A P_{32} P_{32}^{1} A^{\prime}=g(n-1)$, and

$$
\lambda_{4}=\mu^{2} J_{b k m}^{1} A_{32} P_{32}^{A} J_{1}^{b k m} C(0)=0
$$

Hence

$$
\begin{gathered}
s_{5} \sim\left(\sigma^{2}+m r \sigma_{2}^{2}\right) x_{g(n-1)}^{2} \\
E\left(s_{5}\right)=g(n-i)\left(\sigma^{2}+m r \sigma_{2}^{2}\right)
\end{gathered}
$$

6. Distribution of $s_{6}=\mathrm{m}^{-1} \mathrm{Y}^{\mathrm{T}} \mathrm{FP}_{4} \mathrm{P}_{4}^{t} \mathrm{~F}^{t} \mathrm{Y}$ and its expected value are the same as in the BIB Design.
7. Distribution of $s_{7}=Y^{t} \mathrm{P}_{5} \mathrm{P}_{5}^{1} \mathrm{Y}$ and its expected value are the same as in the BIB Designs.
8. Distribution of $s_{8}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{\prime} X_{1} P_{22^{\prime}} P_{31}^{\prime t} A^{\prime} Y$.

We know

$$
P_{22}^{\prime}=\left[m^{2}\left(r k-\lambda_{2} t\right]^{-1 / 2} P_{31}^{1} N\right.
$$

and so

$$
s_{8}=m^{-1} k^{-1} Y^{l} X_{1} N^{l} P_{31} P_{31}^{t} A^{l} Y
$$

Let

$$
A_{7}=m^{-1} k^{-1} X_{1} N^{\prime} P_{31} P_{31}^{1} A^{\prime}
$$

Since $A_{7}$ is not symmetric, we may write $Y^{\ell} A_{7} Y=2^{-1} Y^{\prime}\left[A_{7}+A_{7}^{1}\right] Y^{\prime}$, then since $4^{-1}\left(A_{7}+A_{7}^{1}\right) \not \mathbb{Z}\left(A_{7}+A_{7}^{1}\right)$ is not equal to $2^{-1}\left(A_{7}+A_{7}^{1}\right), s_{8}$ is not distributed as $X^{2}$ variate but as a linear combination of $X^{2}$ variates; that is, $s_{4} \sim \Sigma a_{i} x_{(1)}^{2}$ where $a_{i}$ are the non-zero characteristic roots of $2^{-1}\left(A_{7}+A_{7}^{2}\right)$.

$$
\begin{aligned}
E\left(s_{8}\right) & =E m^{-1} k^{-1} Y^{t} X_{1} N^{t} P_{31} P_{31}^{t} A^{t} Y \\
& =E \operatorname{tr} Y Y^{t} X_{1} N^{\prime} P_{31} P_{31}^{t} A^{\prime} m^{-1} k^{-1} \\
& =(m k)^{-1} \operatorname{tr}\left[X_{1} X_{1}^{t} \sigma_{1}^{2}+X_{2} X_{2}^{t} \sigma_{2}^{2}+X_{3} X_{3}^{t} \sigma_{3}^{2}+\sigma_{I}^{2}\right] X_{1} N^{t} P_{31} P_{31}^{1} A^{t} \\
& =(m k)^{-1} \operatorname{tr}\left[A^{t} X_{2} X_{2}^{t} X_{1} N^{t} P_{31} P_{31}^{t} \sigma_{2}^{2}+A^{t} X_{3} X_{3}^{t} X_{1} N^{t} P_{31} P_{31}^{1} \sigma_{3}^{2}\right] \\
& =(m k)^{-1} \operatorname{tr} P_{31}^{t}\left[m r I-m^{-1} k^{-1} N^{\prime}\right] N N^{t} P_{31} \sigma_{2}^{2} \\
& =(m k)^{-1}\left[m r m^{2}\left(r k-\lambda_{2} t\right)-m^{3} k^{-1}\left(r k-\lambda_{2} t\right)^{2}\right] \sigma_{2}^{2} \operatorname{trace} I_{g-1} \\
& =m^{2} k^{-2}\left(r k-\lambda_{2} t\right)\left[r k-r k+\lambda_{2}^{t}\right] \sigma_{2}^{2}(g-1) \\
& =m^{2} k^{-2}\left(r k-\lambda_{2} t\right)\left(\lambda_{2}^{t}\right)(g-1) \sigma_{2}^{2}
\end{aligned}
$$

## Semi Regular, Group Divisible, PBIB Designs.

In this section we shall find the distributions and expectations of the statistics in the minimal set of sufficient statistics that were found for the semi-regular, group divisible, partially balanced incomplete block design.

1. Distribution of $s_{1}=y \ldots$
$s_{1} \sim N\left[\mu,(b k m)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m r \sigma_{2}^{2}+m \sigma_{3}^{2}\right)\right]$ as follows from $s_{1}$
for singular GD-PBIB Designs. $E\left(s_{1}\right)=\mu$
2. Distribution of $s_{2}=(m k)^{-1} \mathrm{Y}^{t} \mathrm{X}_{1} \mathrm{P}_{21} \mathrm{P}_{21}^{t} \mathrm{X}_{1}^{t} \mathrm{Y}$.

Let

$$
A_{1}=(m k)^{-1} X_{1} P_{21} P_{21}^{1} X_{1}^{1} .
$$

Then

$$
A_{1} A_{1}=A_{1}
$$

and

$$
\begin{aligned}
& A_{1} \nexists A_{1}=(m k)^{-2} X_{1} P_{21} P_{21}^{i} X_{1}^{\prime}\left[X_{1} X_{1}^{i} \sigma_{1}^{2}+X_{2} X_{2}^{i} \sigma_{2}^{2}+X_{3} X_{3}^{i} \sigma_{3}^{2}\right. \\
& \left.+\sigma^{2} I\right] X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime} \\
& =(m k)^{-1} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\left[m k \sigma_{1}^{2}+m \sigma_{3}^{2}+\sigma^{2}\right] \\
& =\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right] A_{1}
\end{aligned}
$$

Let $B_{1}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right]^{-1} A_{1}$. Then $Y^{i} B_{1} Y \sim X^{t^{2}}\left(k_{1}, \lambda_{1}\right)$, where $k_{1}=$ rank of $B_{1}=$ rank of $A_{1}=\operatorname{tr} A_{1}=\operatorname{tr}(m k)^{-1} X_{1} P_{21} P_{21}^{\prime} X_{1}^{1}=b-t+g-1$, and

$$
\lambda_{1} \mu^{2} J_{b k m}^{1} X_{1} P_{21} P_{21}^{1} X_{1}^{4} J_{1}^{b k m} C(\sigma)=0
$$

Hence

$$
\begin{aligned}
& s_{2} \sim\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) X_{b-t+g-1}^{2} \\
& E\left(s_{2}\right)=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)(b-t+g-1)
\end{aligned}
$$

3. Distribution of $s_{3}=(\mathrm{mk})^{-1} \mathrm{Y}^{\mathrm{A}} \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{23}^{\mathrm{A}} \mathrm{X}_{1}^{\mathrm{A}} \mathrm{X}$.

Let

$$
A_{2}=(m k)^{-1} X_{1} P_{23} P_{23}^{\prime} X_{1}^{1}
$$

Then

$$
\mathrm{A}_{2} \mathrm{~A}_{2}=\mathrm{A}_{2}
$$

and

$$
\begin{aligned}
\mathrm{A}_{2} \not Z_{A} \mathrm{~A}_{2}=(\mathrm{mk})^{-2} \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{23}^{1} \mathrm{X}_{1}^{1}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{1} \sigma_{1}^{2}\right. & +\mathrm{X}_{2} \mathrm{X}_{2}^{1} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{1} \sigma_{3}^{2} \\
& \left.+\sigma^{2} \mathrm{I}\right] \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{23}^{1} \mathrm{X}_{1}^{1}
\end{aligned}
$$

$$
\begin{aligned}
& =(m \mathrm{k})^{-1}\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \mathrm{X}_{1} \mathrm{P}_{23} \mathrm{P}_{23}^{\prime} \mathrm{X}_{1}^{\prime} \\
& =\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right] \mathrm{A}_{2}
\end{aligned}
$$

Let $B_{2}=\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right]^{-1} A_{2}$. Then $Y{ }^{\prime} B_{2} Y \sim X^{\prime}{ }^{2}\left(k_{2}, \lambda_{2}\right)$ where $k_{2}=$ rank of $B_{2}=$ rank of $A_{2}=\operatorname{tr} A_{2}=(m k)^{-1} \operatorname{tr} X_{1}^{\prime} P_{23} P_{23}^{\prime} X_{1}^{\prime}=g(n-1)$ and

$$
\lambda_{3}=\mu^{2} \mathrm{~J}_{\mathrm{bkm}}^{\mathrm{I}} \mathrm{X}_{1} \mathrm{P}_{23}{ }_{23}^{\mathrm{P}}{ }_{23} \mathrm{X}_{1}^{\mathrm{t}} \mathrm{~J}_{1}^{\mathrm{bkm}} \mathrm{C}(\Phi)=0
$$

Hence

$$
\begin{aligned}
& s_{3} \sim\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1} \sigma_{2}^{2}+m \sigma_{3}^{2}\right] x_{g(n-1)}^{2}\right. \\
& E\left(s_{3}\right)=g(n-1)\left[\sigma^{2}+m k \sigma_{1}^{2}+m k^{-1}\left(r-\lambda_{1}\right) \sigma_{2}^{2}+m \sigma_{3}^{2}\right]
\end{aligned}
$$

4. Distribution of $s_{4}=(\mathrm{mr})^{-1} \mathrm{Y}^{\prime} A P_{31} P_{31}^{1} A^{\prime} \mathrm{Y}$

Let

$$
\mathrm{A}_{3}=(\mathrm{mr})^{-1} \mathrm{AP}_{31} \mathrm{P}_{31}^{\prime} \mathrm{A}^{\mathrm{A}} .
$$

Then

$$
\mathrm{A}_{3} \mathrm{~A}_{3}=\mathrm{A}_{3}
$$

and

$$
\begin{aligned}
& \mathrm{A}_{3} \not Z^{\prime} \mathrm{A}_{3}=(\mathrm{mr})^{-2} \mathrm{AP}_{31} P_{31}^{1} A^{\prime}\left[X_{1} X_{1}^{1}{ }_{1}^{2}+X_{2} X_{2}^{1}{ }_{2}^{2}+X_{3} X_{3}^{1} \sigma_{3}^{2}\right. \\
& +\sigma^{2} I \mathrm{AP}_{31} \mathrm{P}_{31}^{\prime} \mathrm{A}^{\prime} \\
& =(m r)^{-1}\left[\sigma^{2}+m r \sigma_{2}^{2}\right] A P_{31} P_{31}^{1} A^{\prime} \\
& =\left[\sigma^{2}+\operatorname{mr} \sigma_{2}^{2}\right] A_{3}
\end{aligned}
$$

Let $B_{3}=\left[\sigma^{2}+m r \sigma_{2}^{2}\right]^{-1} A_{3}$. Then $Y^{1} B_{3} Y \sim X^{t^{2}}\left(k_{3}, \lambda_{3}\right)$, where $k_{3}=$
rank of $\mathrm{B}_{3}=$ rank of $\mathrm{A}_{3}=\operatorname{tr} \mathrm{A}_{3}=(\mathrm{mr})^{-1} \operatorname{tr} A P_{31} P_{31}^{1} A^{4}=g-1$, and

$$
\lambda_{4}=\mu^{2} J_{1}^{b k m} \mathrm{AP}_{31} P_{31}^{1} \mathrm{~A}^{\prime} \mathrm{J}_{1}^{\mathrm{bkm}} \mathrm{C}(0)=0
$$

Hence

$$
\begin{aligned}
& s_{4} \sim\left(\sigma^{2}+m r \sigma_{2}^{2}\right) x_{(m-1)}^{2} \\
& E\left(s_{4}\right)=(g-1)\left(\sigma^{2}+m r \sigma_{2}^{2}\right)
\end{aligned}
$$

5. Distribution of $s_{5}=(\mathrm{mv})^{-1} \mathrm{Y}^{\prime} \mathrm{AP} \mathrm{S}_{32} \mathrm{P}_{32}^{\prime} \mathrm{AY}$

Let

$$
\mathrm{A}_{4}=(\mathrm{mv})^{-1} \mathrm{AP}_{32} \mathrm{P}_{32}^{1} \mathrm{~A}^{\prime}
$$

Then

$$
\mathrm{A}_{4} \mathrm{~A}_{4}=\mathrm{A}_{4}
$$

and

$$
\begin{aligned}
& A_{4} \not \subset A_{4}=(\mathrm{mv})^{-2} \mathrm{AP}_{32} P_{32}^{1} A^{\prime}\left[X_{1} X_{1}^{1} \sigma_{1}^{2}+X_{2} X_{2}^{1}{ }_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}\right. \\
& \left.+\sigma^{2} \mathrm{I}\right] \mathrm{AP}_{32} \mathrm{P}_{32}^{\mathrm{A}} \mathrm{~A}^{\mathrm{A}} \\
& =(\mathrm{mv})^{-1}\left[\sigma^{2}+\mathrm{mv} \mathrm{\sigma}_{2}^{2}\right] \mathrm{AP}_{32} \mathrm{P}_{32}^{\mathrm{B}} \mathrm{~A}^{\mathrm{B}} \\
& =\left[\sigma^{2}+\operatorname{mv\sigma }_{2}^{2}\right] A_{4}
\end{aligned}
$$

Let $B_{4}=\left[\sigma^{2}+\operatorname{mv\sigma }_{2}^{2}\right]^{-1} A_{4}$. Then $Y^{2} B_{4} Y \sim X^{\prime 2}\left(k_{4}\right.$, $\left.\lambda_{4}\right)$, where $k_{4}=$ rank of $B_{4}=$ rank of $A_{4}=\operatorname{tr} A_{4}=(m v)^{-1} \operatorname{tr} A P_{32} P_{32}^{\prime} A^{1}=g(n-1)$, ard

$$
\lambda_{5}=\mu^{2} J_{b k m}^{1} A P_{32} P_{32}^{s} A^{l} J_{1}^{b k m} C(v)=0
$$

Hence

$$
s_{5} \sim\left(\sigma^{2}+m v \sigma_{2}^{2}\right) x_{[g(n-1)]}^{2}
$$

$$
E\left(s_{5}\right)=\left[\sigma^{2}+\operatorname{mv\sigma _{2}^{2}}\right][g(n-1)]
$$

6. The distribution of $s_{6}=m^{-1} Y^{1} \mathrm{FP}_{4} \mathrm{P}_{4}^{\mathrm{t}} \mathrm{F}^{\boldsymbol{t}} \mathrm{Y}^{\mathrm{t}}$ and its expectation are the same as those for BIB Designs.
7. The distribution of $s_{7}=Y^{\prime} \mathrm{P}_{5} P_{5}^{\prime} Y^{i}$ and its expectation are the same as those for BIB Designs.
8. Distribution of $s_{8}=\left[\mathrm{m}^{2} \mathrm{k}^{-2}\left(\mathrm{r}-\lambda_{\mathrm{I}}\right)\right]^{1 / 2} \mathrm{Y}^{\mathrm{I}} \mathrm{X}_{\mathrm{I}} \mathrm{P}_{23} \mathrm{P}_{32^{1}} \mathrm{~A}^{\mathrm{I}} \mathrm{Y}$. We know

$$
\begin{aligned}
\mathrm{P}_{23}^{\prime} & =\left[\mathrm{m}^{2}\left(\mathrm{r}-\lambda_{1}\right)\right]^{-1 / 2} \mathrm{P}_{32}^{\prime} \mathrm{N} \\
\mathrm{~s}_{8} & =\mathrm{k}^{-1} \mathrm{Y}^{\prime} \mathrm{X}_{1} \mathrm{~N}^{\mathrm{t}} \mathrm{P}_{32} \mathrm{P}_{32}^{\prime} \mathrm{A}^{\prime} \mathrm{Y}
\end{aligned}
$$

Let

$$
A_{7}=k^{-1} X_{1} N^{t} P_{32} P_{32}^{1} A^{\prime}
$$

Since $A_{7}$ is not symmetric, we may write $Y^{\prime} A_{7} Y=2^{-1} Y^{\prime}\left(A_{7}+A_{7}^{1}\right) Y$. Then since $4^{-1}\left(A_{7}+A_{7}^{1}\right) \neq\left(A_{7}+A_{7}^{1}\right) \neq 2^{-1}\left[A_{7}+A_{7}^{1}\right], s_{8}$ is not distributed as $X^{2}$ variate, but as a linear combination of $X^{2}$ variates. That is, $s_{8} \sim \Sigma \mathrm{a}_{\mathrm{i}} \mathrm{X}_{(1)}^{2}$ where $\mathrm{a}_{\mathrm{i}}$ are the non-zero characteristic roots of $2^{-1}\left(A_{7}+A_{7}^{1}\right) \nexists 1$.

$$
\begin{aligned}
& \mathrm{E}\left(\mathrm{~s}_{8}\right)=k^{-1} \mathrm{E} \operatorname{tr}\left(\mathrm{Y}^{\mathrm{t}} \mathrm{X}_{1} \mathrm{~N}^{\mathrm{t}} \mathrm{P}_{32} \mathrm{P}_{32^{\prime}} \mathrm{A}^{\mathrm{I}} \mathrm{Y}\right) \\
& =k^{-1} \operatorname{tr} E\left(Y^{\prime} X_{1} N^{\prime} P_{32^{\prime}} P_{32}^{\prime} A^{\prime}\right) \\
& =\mathrm{k}^{-1} \operatorname{tr}\left[\mathrm{X}_{1} \mathrm{X}_{1}^{\mathrm{t}}{ }_{1}^{2}+\mathrm{X}_{2} \mathrm{X}_{2}^{\mathbf{1}} \sigma_{2}^{2}+\mathrm{X}_{3} \mathrm{X}_{3}^{\mathbf{1}} \sigma_{3}^{2}+\sigma^{2} \mathrm{I}\right] \mathrm{X}_{1} \mathrm{~N}^{\mathrm{t}} \mathrm{P}_{32} \mathrm{P}_{32}^{\mathbf{1}} \mathrm{A}^{\mathrm{s}} \\
& =k^{-1} \operatorname{tr} P_{32}^{\prime} A_{1}^{\prime} X_{2} X_{2}^{t} X_{1} N^{t} P_{32^{\sigma}}^{2} \\
& =\mathrm{k}^{-1} \operatorname{tr} \mathrm{P}_{32}^{1}\left(\mathrm{rmI}-\mathrm{m}^{-1} \mathrm{k}^{-1} \mathrm{NN}^{i}\right) \mathrm{NN}^{i} \mathrm{P}_{32^{\sigma}}{ }_{2}^{2}
\end{aligned}
$$

$$
\begin{aligned}
& =k^{-1} \operatorname{tr}\left[r m^{3}\left(r-\lambda_{1}\right)-k^{-1} m^{3}\left(r-\lambda_{1}\right)^{2}\right] I_{g(n-1)} \sigma_{2}^{2} \\
& =k^{-2} m^{3}\left(r-\lambda_{1}\right)\left[r k-r+\lambda_{1}\right] \operatorname{tr} I_{g(n-1)^{\sigma}}^{2} \\
& =g(n-1) m^{3}\left(r-\lambda_{1}\right)\left[r k-r+\lambda_{1}\right] k^{-2} \sigma_{2}^{2}
\end{aligned}
$$

Regular GD-PBIB Designs.
In this section we shall derive the distributions and expectations of the statistics in the minimal set of sufficient statistics that were found for the regular group divisible partially balanced incomplete block designs.

1. Distribution of $s_{1}=y \ldots$ and its expectation will correspond to those of $s_{1}$ for S-GD-PBIB Designs.
2. Distribution of $s_{2}=(m k)^{-1} \mathrm{Y}^{t} \mathrm{X}_{1} \mathrm{P}_{21} \mathrm{P}_{21}^{\boldsymbol{t}} \mathrm{X}_{1}^{\prime \mathrm{Y}}$

Let

$$
A_{1}=(m k)^{-1} X_{1} P_{21} P_{21}^{i} X_{1}^{1}
$$

Then

$$
A_{1} A_{1}=A_{1}
$$

and

$$
\begin{aligned}
& A_{1} \nexists A_{1}=(m k)^{-2} X_{1} P_{21} P_{21}^{\prime} X_{1}^{\prime}\left[X_{1} X_{1}^{\prime} \sigma_{1}^{2}+X_{2} X_{2}^{\prime} \sigma_{2}^{2}+X_{3} X_{3}^{\prime} \sigma_{3}^{2}\right. \\
& \left.+\sigma^{2} \mathrm{I}\right] \mathrm{X}_{1} \mathrm{P}_{21} \mathrm{P}_{21}^{2} \mathrm{X}_{1}^{\prime} \\
& =(m k)^{-1}\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) X_{1} P_{21} P_{21}^{1} X_{1}^{1} \\
& =\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) A_{1}
\end{aligned}
$$

Let $B_{1}=\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)^{-1} A_{1}$. Then $Y^{\prime} B_{1} Y \sim X^{\prime 2}\left(k_{1}, \lambda_{1}\right)$, where

$$
\begin{gathered}
k_{1}=\text { rank of } B_{1}=\operatorname{rank} \text { of } A_{1}=\operatorname{tr} A_{1}=\operatorname{tr}(m k)^{-1} X_{1} P_{21} P_{21}^{1} X_{1}^{1}=b-t, \text { and } \\
\lambda_{1}=\mu^{2} J_{b k m}^{1} X_{1} P_{21} P_{21}^{1} X_{1}^{1} J_{1}^{b k m} C(0)=0
\end{gathered}
$$

Hence

$$
\begin{aligned}
& s_{2} \sim\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right) x_{(b-t)}^{2} \\
& E\left(s_{2}\right)=(b-t)\left(\sigma^{2}+m k \sigma_{1}^{2}+m \sigma_{3}^{2}\right)
\end{aligned}
$$

3. The distribution of $s_{3}=(m k)^{-1} Y^{t} X_{1} P_{22} P_{22}^{\prime} X_{1}^{1 Y}$ and its expectation will correspond to those of $s_{3}$ for S-GD-PBIB Designs.
4. The distribution of $s_{4}=(\mathrm{mk})^{-1} \mathrm{Y}^{!} \mathrm{X}_{1} P_{23} \mathrm{P}_{23}^{\prime} \mathrm{X}_{1}^{t} \mathrm{Y}$ and its expectation will correspond to those of $s_{3}$ for SR-GD-PBIB Designs.
5. The distribution of $s_{5}=\frac{k}{\lambda t m} Y^{t} A P_{31} P_{31}^{t} A^{t} Y$ and its expectation will correspand to those of $s_{4}$ for S-GD-PBIB Designs.
6. The distribution of $s_{6}=(m v)^{-1} Y^{t} A P_{32} P_{32^{\prime}} A^{t} Y$ and its expectation will correspond to those of $s_{5}$ for SR-GD-PBIB Designs.
7. The distribution of $s_{7}=\mathrm{m}^{-1} \mathrm{Y}^{\prime} \mathrm{FP}_{4} \mathrm{P}_{4}^{1} F$ and its expectation will correspond to those of $s_{6}$ for S-GD-PBIB Designs.
8. The distribution of $s_{8}=Y^{i} P_{5} P_{5}^{\prime} Y$ and its expectation will corcespond to those of $s_{7}$ for S-GD-PBIB Designs.
9. The distribution of $s_{9}=\left[k^{-2}\left(r k-\lambda_{2} t\right)\right]^{1 / 2} Y^{t} X_{1} P_{22^{2}} P_{31}^{1} A^{\prime} Y$ and its expectation will correspond to those of $s_{8}$ for $S-G D-P B I B$ Designs. 10. The distribution of $s_{10}=\left[k^{-2}\left(r-\lambda_{1}\right)\right]^{1 / 2} Y^{t} X_{1} P_{23} P_{32}^{\prime} A^{\prime} Y$ and j.ts expectation will correspond to those of $s_{8}$ for SR-GD-PBIB Designs.

## APPENDIX IV

Now we shall determine the pairwise independence of statistics in the minimal set.

In order to determine pairwise independence, we shall make use of the well known theorem:

If the bkm x 1 vector Z is distributed as the multivariate normal with mean $\mu$ and covariance matrix $\nexists$ and if $Z_{1}, Z_{2}, \ldots, Z_{q}$ are subvectors of $Z$ such that $Z=\left(Z_{1}, Z_{2}, ., Z_{q}\right)$, then a necessary and sufficient condition that the subvectors are jointly independent is that all the sub-matrices $\sharp_{i j}(i \neq j)$ be equal to the null matrix.

In the balanced incomplete block design, we defined the vector $Y$ and transformed $Y$ to $Z$ by the relation $Z=P^{t} Y$. Then

$$
\mathrm{Z} \sim \operatorname{MVN}\left[P^{i} \mu, P^{\prime} \notin P\right]
$$

We then formed a partition of $Z$ into $\left(Z_{1}, Z_{2}, Z_{3}, Z_{4}, Z_{5}, Z_{6}\right)$. The form of $P \mathbb{Z} P$ is as given in Table $I$ and is the covariance matrix of $Z$.

By making use of the above theorem, we have $Z_{1}, Z_{2}, Z_{5}, Z_{6}$, as mutually independent and they are independent of $Z_{3}$ and $Z_{4}$ and that $Z_{3}$ and $Z_{4}$ are not independent. We can have the following relationship.

$$
\begin{aligned}
& s_{1}=Z_{1} \\
& s_{2}=Z_{2}^{t} Z_{2}
\end{aligned}
$$

$s_{3}=Z_{3}^{1} Z_{3}$
$s_{5}=Z_{4}^{1} Z_{4}$
$s_{6}=Z_{5}^{1} Z_{5}$
$s_{7}=Z_{6}^{1} Z_{6}$
$s_{4}=\mathrm{Z}_{3}^{1} \mathrm{Z}_{4}$

Hence we conclude that the statistics in the minimal set of sufficient statistics are pairwise independent except for the pairs ( $\left.s_{3}, s_{4}\right),\left(s_{3}, s_{5}\right)$ and $\left(s_{4}, s_{5}\right)$.

The Singular, Group Divisible PBIB Design.
Following the procedure given in previous section and examining Table XIII, we have the results as stated in Corollary 2.3.

## The Semi-Regular, Group Divisible PBIB Design.

Following a procedure similar to that of the first section and examining Table $X$, we have the results as stated in Corollary 3. 3 .

The Reguilar, Group Divisible PBIB Design.
Again following the procedure of the first section and examining Table XII, we have the results as stated in Corollary 4.3.

## APPENDIX V

In what follows we shall try to associate each of the statistics in the minimal set with block-treatment and interaction sum of squares.
(1) $s_{1}$. This statistic is the mean of all observations in the vector $Y$ and is the unbiased estimate of $\mu$.
(2) $s_{3}=\left[\mathrm{km}^{3}(r-\lambda)\right]^{-1} Y^{\prime} X_{1} N^{t} P_{3} P_{3}^{\prime} N X_{1}^{\prime} Y$. The quantity $N X_{1}^{\prime Y}$ is a $t \times 1$ vector of elements $T_{j}$ (say) where $T_{j}$ is the total of all blocks containing treatment $j . \quad P_{3} P_{3}^{1}$ can be replaced by $\left(I \sim t^{-1} J\right)$. Making this substitution, we have

$$
\begin{aligned}
s_{3} & =\left[\mathrm{km}^{3}(r-\lambda)\right]^{-1} Y^{t} X_{1} N^{i}\left(I-t^{-1} J\right) N X_{1}^{t} Y \\
& =\left[\mathrm{km}^{3}(r-\lambda)\right]^{-1}\left[Y^{t} X_{1} N^{\prime} N X_{1}^{\prime Y}-t^{-1} Y^{t} X_{1} N^{t} J N X_{1}^{\prime} Y\right] \\
& =\left[\mathrm{km}^{3}(r-\lambda)\right]^{-1}\left[\Sigma \mathrm{~T}_{j}^{2}-t^{-1}(k Y \ldots)^{2}\right] \\
& =\left[\mathrm{km}^{3}(r-\lambda)\right]^{-1} \Sigma\left(T_{j}-T \cdot\right)^{2}
\end{aligned}
$$

where $T .=t^{-1} \Sigma T_{j}$ and $Y \ldots=J_{b k m}^{1} Y$.
(3) $s_{5}=\frac{k}{\lambda t m} Y^{\prime} A P_{3} P_{3}^{\prime} A^{\prime} Y$. If we replace $P_{3} P_{3}^{\prime}$ by $I-t^{-1} J_{\text {, we have }}$

$$
s_{5}=\frac{k}{\lambda t m} X^{I} A\left(I-t^{-1} J\right) A^{\prime} Y=\frac{k}{\lambda t m} Y^{\prime} A A^{\prime} Y
$$

Consider $A^{\prime \prime} Y=\left(X_{2}^{1}-m^{-1} k^{-1} N X_{1}^{1}\right) Y$. This we shall denote by $Q_{j}{ }^{1} s$ and it has the same conventionally known interpretation as we have one
observation per cell. Therefore,

$$
s_{5}=\frac{k}{\lambda t m} \Sigma Q_{j}^{2}
$$

(4) $s_{6}=m^{-1} Y^{\prime} P_{4} F^{\prime} P_{4} Y$. The way in which we have picked $P_{4}$, assures us that $s_{6}=m^{-1} \mathrm{Y}^{1} \mathrm{FF}^{\prime} \mathrm{Y}$. This is true since $P_{4}^{8}$ is $\mathrm{bk}-\mathrm{b}-\mathrm{t}+\mathbb{1} \times \mathrm{bk}$ orthogonal vectors of the $b k x b k$ orthogonal matrix which diagonalizes the idempotent matrix $\mathrm{m}^{-1} \mathrm{~F}^{4} \mathrm{~F}$ which has rank $b k-b-t+1$. Let us call this orthogonal matrix 0 . Let

$$
0^{\prime}=\left[\begin{array}{c}
P_{4}^{\prime} \\
4 \\
P_{41}^{\prime}
\end{array}\right]
$$

where $P_{4}^{\prime}$ is $b k-b-t+1 \times b k$ and $P_{41}^{\prime}$ is $b+t-1 \times$ bk orthogonal vectors. Since

$$
0^{\prime} \mathrm{m}^{-1} \mathrm{~F}^{\mathrm{t}} \mathrm{~F} 0=\left[\begin{array}{ll}
I_{b k-b-t+1} & \phi \\
\phi & \phi
\end{array}\right]
$$

we have

$$
m^{-1} P_{41}^{t} F^{t} F P_{41}=\phi
$$

Therefore,

$$
m^{-1} Y^{\prime} F P_{4} P_{4}^{\prime} F^{\prime Y}=m^{-1} Y^{\prime} F\left[I-P_{41} P_{41}^{\prime} F^{\prime Y}=m^{-1} Y^{\prime} F F^{\prime} Y\right.
$$

If we substitute

$$
\begin{aligned}
F^{\prime}=X_{3}^{\prime}-m^{-1} k^{-1} M^{\prime} X_{1}^{\prime} & -m^{-1} \lambda^{-1} t^{-1} k\left(L^{\prime}-m^{-1} k^{-1} M^{\prime} N^{y}\right)\left(X_{2}^{1}\right. \\
& \left.-m^{-1} k^{-1} N X_{1}^{\prime}\right)
\end{aligned}
$$

then

$$
m^{-1} Y^{\prime} F^{\prime} Y=Y^{\prime}\left[m^{-1} X_{3} X_{3}^{1}-m^{-1} k^{-1} X_{1} X_{1}^{\prime}-\frac{k}{\lambda t m} A A^{\prime}\right] Y
$$

But the right hand side is the interaction sum of squares as shown below.

$$
\begin{aligned}
& R[\mu, \tau, \beta,(\beta \tau)]=\sum_{i j} \frac{Y_{i j}^{2}}{n_{i j}} \text {; where } Y_{i j}=\sum_{k} y_{i j k} \\
& R[\mu, \tau, \beta]=m^{-1} k^{-1} \sum_{i=1}^{b} Y_{i} \cdots+\frac{k}{\lambda \operatorname{tm}} \sum_{j=1}^{t} Q_{j}^{2} ; \text { where } Y_{i} \cdots=\underset{j}{\sum \sum_{k} y_{i j k}}
\end{aligned}
$$

Therefore,

$$
\begin{aligned}
R(\beta \tau \mid \mu, \tau, \beta] & =R[\mu, \tau, \beta,(\beta \tau)]-R(\mu, \tau, \beta) \\
& =\Sigma \frac{Y_{i j}^{2}}{n_{i j}}-m^{-1} k^{-1} \sum_{i=1}^{b} Y_{i} \cdots-\frac{k}{\lambda t m} \sum_{j=1}^{t} Q_{j}^{2} \\
& =m^{-1} Y^{\prime} X_{3} X_{3}^{i} Y-m^{-1} k^{-1} Y^{\prime} X_{1} X_{1}^{\prime} Y-\frac{k}{\lambda t m} Y^{\prime} A A^{\prime} Y \\
& =m^{-1} Y^{\prime} F^{\prime} Y
\end{aligned}
$$

Therefore,

$$
\begin{aligned}
s_{6} & =m^{-1} Y X_{3} X_{3}^{1} Y-m^{-1} k^{-1} Y^{i} X_{1} X_{1}^{\prime Y}-\frac{k}{\lambda t m} Y^{\prime} A^{\prime} Y \\
& =m^{-1}\left[\sum_{n=1}^{b k} C_{2}^{2}-k^{-1} \sum_{i=1} B_{i}^{2}-\frac{k}{\lambda t} \Sigma Q_{j}^{2}\right]
\end{aligned}
$$

where $C_{n}$ is the $n-t h$ element of $X \frac{1}{3} Y$.
(5) $\mathrm{s}_{7}=\mathrm{Y} \mathrm{P}_{5}^{:} \mathrm{P}_{5}^{1} \mathrm{Y}$. In view of the above arguments we can infer that $s_{7}$ is the intra-block error.

VITA
Chandrakant Harilal Kapadia
Candidate for the Degree of
Doctor of Philosophy

## Thesis: VARIANCE COMPONENTS IN TWO-WAY CLASSIFICATIONS MODELS WITH INTERACTION

Major Field: Mathematical Statistics

## Biographical:

Personal Data: Born in Bombay, India, October 7, 1930, the son of Harilal M. and Jadavben Kapadia.

Education: Attended grade school at Dohad, Gujarat State; graduated from New High School, Dohad Gujarat State, India in 1948; received Bachelor of Arts degree from Siddharth College, University of Bombay, with a major in Mathematics, in 1952; received the Master of Arts degree from Siddharth College, University of Bombay, with a major in Mathematics, in 1955; received the Master of Arts degree from The Ohio State University, with a major in Mathematics, in 1959; completed requirements for the Doctor of Philosophy degree in August, 1961.

Professional experience: Served as a lecturer in Mathematics in S. B. Garda College, Navsari, India, from 1955 to 1957; part time graduate assistant from 1957 to 1958 , and part time research assistant from 1958 to 1959, at The Ohio State University; graduate teaching assistant at Oklahoma State University from 1960 to 1961.
