A STUDY OF PHYSICAL FITNESS OF OKLAHOMA 4-H CLUB MEMBERS

Thesis Approved:

## 569566

## ACKNOWLEDGMENTS

The author gratefully acknowledges the assistance of his major advisor, Dr. A. B. Harrison, who has patiently directed every aspect of this study and carefully examined the manuscript. He has been especially helpful in the organization and administration of the test battery used. Acknowledgment is extended to the Oklahoma $4-\mathrm{H}$ Club leaders who initiated and supported the physical fitness clinic used as a basis for this thesis. To the many who volunteered to help administer the tests go my grateful thanks for their prompt and responsible assistance. My wife, Linda, cheerfully assisted in every phase and suggested many editorial improvements to the manuscript. My thanks go to Sharon Cranston who efficiently typed this thesis.

## CHAPTER I

## INTRODUCTION

Impetus for this study was initiated by the Oklahoma State $4-\mathrm{HClub}$ leaders. They felt that insufficient attention was being given to the " H " which represented health. It was decided that, at the 19630 kl ahoma $4-\mathrm{H}$ Club Round-Up, there should be a physical fitness clinic. At the request of the $4-\mathrm{H}$ Club leaders to the Oklahoma State University Physical Education Department, a battery of physical fitness tests were devised which could be administered to a portion of the club members attending the 1963 Spring Round-up.

In the past few years, there has been a great deal of study and research directed toward measurement of physical fitness in school age children. One of the problems is that it is difficult to find suitable physical fitness tests which have acceptable standards established. Another related problem is having a sufficient number of subjects available to be tested so that acceptable standards can be determined for the test items used. The combined situations of (1) increased interest in physical fitness by the $4-\mathrm{H}$ Club leaders, (2) the interest of the university physical education faculty, and (3) a sufficient number of subjects to be tested presented an ideal opportunity for this study.

Statement of the Problem

The purpose of this study was to administer a battery of tests which would assess the physical fitness level of Oklahoma $4-\mathrm{HClub}$ members and
provide standard scores for this group on the tests used. A subproblem was to compare the scores of the Oklahoma $4-\mathrm{H}$ Club youths with those of other groups on selected fitness items.

## Limitations of the Study

The standards established on these tests may be slightly higher than the standards that would actually represent the Oklahoma $4-\mathrm{H}$ population. The reason for this being that the members took part in these tests on a voluntary basis and the ones which were interested in their physical fitness may have been more physically inclined than those who did not participate.

The rope climb was used as a test of strength. It was possible for a subject to make a perfect score or climb to the top of the rope. Many of the subjects ( 53 per cent) made perfect scores. The balance test also had an upper limit which made it possible for the subject to get a perfect score. Since these scores were not continously distributed, it was not possible to distinguish each subject's capacity from those of the other subjects on these two tests. For this reason, no attempt was made to produce standards on the strength test and the balance test.

A greater number of subjects would have been more desirable. Several hundred volunteers were anticipated, but only 199 took part. As in most statistical studies, a larger sample provides a better replica of the entire population.

```
Definition of Terms
```

Physical fitness has been a consistently accepted objective of physical education throughout the history of the field; however, there is much
difficulty in measurement in this area due to the lack of a concise and generally accepted definition of the term physical fitness. ${ }^{1}$ The problem is further complicated by the lack of agreement and understanding of what should be included in a definition of physical fitness and the degree of interrelationship among its components. Although there are many viewpoints on physical fitness, that of Dr. T. K. Cureton, University of Illinois, is generally accepted as a frame of reference for this study. His ideas are presented, in brief, in the following paragraphs.

Physical fitness is a part of one's total fitness. It does not include the aspects of social, emotional, and mental fitness. Social fitness deals with adaptability to the group and to particular friends. Emotional fitness is concerned with feelings. The power of thought is dealt with in mental fitness. Physical fitness can be thought of as the ability to handle the body well and the capacity to work hard over a long period of time without diminished efficiency. ${ }^{2}$ More specifically, physical fitness can be thought of as the degree of strength, balance, flexibility, power, agility, and endurance which an individual possesses. ${ }^{3}$

The following definitions of the characteristics of physical fitness are taken from Cureton's book, Physical Fitness Appraisal and Guidance: ${ }^{4}$
${ }^{1}$ John F. Bovard, Frederick W. Cozens, and E. Patricia Hagman, Tests and Measurements in Physical Education (Philadelphia, 1949), p. 167.
${ }^{2}$ T. K. Cureton, Physical Fitness Appraisal and Guidance (St. Louis, 1947), p. 18.
${ }^{3}$ T. K. Cureton, Physical Fitness of Champion Athletes (Urbana, Illinois, 1951), p. 4 .
${ }^{4}$ Cureton, Physical Fitness Appraisal and Guidance, p. 18.
Strength --- emphasizes the capacity of the body, or the hands or legs to exert great force. Strength in its ultimate analysis is a complex human quality involving will power, the number of muscle fibers that can be brought into the act, the efficiency of the levers involved -- all to develop coordinated effort against the particular resistance.
Balance --- emphasizes mental control and poise, the kinesthetic sense of position, and the various anatomical and physiological capacities which regulate acts of balance.
Flexibility --- emphasizes the capacity of the body to move easily to the full range of joint flexion and extension without undue restrictions in the joints or tissues.
Power --- emphasizes the capacity to release great explosive effort to execute fast or sudden efforts which move the entire body with maximum effort.
Agility --- emphasizes the capacity for fast reaction in controlled movement where accuracy is also a feature. The ability to handle the body quickly and precisely, not necessarily with maximum force or power.
Endurance --- emphasizes capacity for continuous exertion with partial recovery during the exercise.

## CHAPTER II

## REVIEW OF LITERATURE

Testing and appraisal of physical status has been a major interest of physical educators since the beginning of organized physical education in the United States. In 1880 , Dr. Dudley A. Sargent began a systematic study of Harvard students as a basis for determining physical standards for American college men. This effort resulted in what Sargent called the Intercollegiate Strength Test, ${ }^{1}$ consisting of lung capacity and strength of back, legs, grip, and arms. ${ }^{2}$ Since the efforts of Sargent, there have been many studies directed toward the measurement of muscular strength and physical fitness.

In the early $1940^{\prime}$ s, motor fitness tests for college men, high school boys and girls, and elementary school children were developed at Indiana University. The test items included pull-ups, push-ups, vertical jumps, standing broad jump, and the squat thrust for twenty seconds. ${ }^{3}$

In 1947, Cureton recognized and confirmed by factor analysis six components of motor fitness -- balance, flexibility, agility, strength, power, and endurance. ${ }^{4}$ At the University of Illinois, under the direction
$1_{D}$. A. Sargent, "Intercollegiate Strength Test," American Physical Education Review, II (December, 1897), p. 216.
${ }^{2}$ T. E. Blesh and C. R. Meyers, Measurement in Physical Education (New York, 1962), p. 188.
${ }^{3}$ Ibid., p. 219.
${ }^{4}$ Ibid., p. 221.
of Cureton, two test batteries were developed: one of fourteen items, requiring some apparatus and facilities for running the mile, and the second of eighteen items, requiring no apparatus. The fourteen item Motor Fitness Screen Test included foot and toe balance, squat stand, trunk extension flexibility, trunk flexion, sitting, extension press-ups, man lift and let down, leg lifts and sit-ups, medicine ball put, Illinois Agility Run, skin the cat, bar or fence vault, chinning, standing broad jump, and mile run. ${ }^{5}$

Probably the most controversial test in physical education and yet the most provocative and influential test in terms of the significance of its findings for physical education and the American mode of 1 iving ${ }^{6}$ has been the Kraus-Weber test of Minimum Muscular Fitness, $1954 .^{7}$ Dr. Hans Kraus spent some eighteen years developing these tests as a result of his interest in the relation between low back disorders and poor muscular fitness. Six items were selected which represented the most valid test of a large battery administered in clinical experiences. These tests were designed to indicate a level of strength and flexibility for certain key muscle groups below which the functioning of the body seemed to be impaired. Basically, the tests were graded on a pass or fail basis, but the authors provided a means of scoring partial movements. The six tests were:

Test 1: Abdominal Plus Psoas Muscle Strength
Test 2: Abdominal Muscle Strength Minus Psoa's
Test 3: Psoas and Lower Abdominal Muscle Strength
${ }^{5}$ T. K. Cureton, Physical Fitness Workbook (St. Louis, 1947), pp. 13-14.
${ }^{6}$ B1esh and Meyers, p. 188.
${ }^{7}$ Hans Kraus and Ruth P. Hirsch1and, "Minimum Muscular Fitness in School Children," Research Quarterly XXV: 2 (May, 1954), p. 178.

Test 4: Upper Back Muscle Strength
Test 5: Lower Back Muscle Strength
Test 6: Back and Hamstring Muscle Strength
Kraus and Hirsch1and administered these tests to 4,458 American school children and compared the results with 3,156 European children. It was found that 57.9 per cent of the American children failed the test and only 8.7 per cent of the European children failed. ${ }^{8}$

In 1957, selected members of the Research Council of the AAHPER devised the AAHPER Youth Fitness Test as a means of surveying the fitness of American youth. A battery of seven tests was developed. During the 1957-1958 school year, 8,500 school children in grades five through twelve in twenty-eight states were tested with the fitness test battery. 9 After completing the testing a manual was prepared describing the test and its administration, as well as giving norms for different age levels. The manual is known as the AAHPER Youth Fitness Test Manual. ${ }^{10}$ The test items included in the manual were: (1) pull-ups; (2) sit-ups; (3) 40~ yard shuttle run; (4) standing broad jump; (5) 50-yard dash; (6) softball throw for distance; and (7) 600-yard run-walk. Three aquatic tests, two on pass or fail basis and one time event, were included in the manual, but no norms were available for them. ${ }^{11}$

The New York State Education Department, in 1958 , published a test designed to provide schools with a convenient instrument for periodic evaluation of status and progress in physical fitness of boys and girls

```

    \({ }^{9}\) Ibid., pp. 217-218.
\({ }^{10}\) AAHPER Youth Fitness Test Manual (Washington, D.C., 1958), 55 pp.
\({ }^{11}\) Ibid., pp. 4-13.
```

in grades four through twelve. Seven basic components of total physical fitness were measured by the New York State Physical Fitness Test. ${ }^{12}$ The components and test items included were:

Posture --- Posture Rating Chart
Accuracy --- The Target Throw
Strength --- Pull Ups
Agility --- Sidestep Test
Speed --- The 50-yard Dash
Balance --- The Squat Stand
Endurance --- The Treadmill
The New York State Physical Fitness Test booklet was intended to serve as a manual for teachers and contained test directions, record forms, and norm tables derived from administering the test to 12,626 pupils in twentysix school districts throughout the state of New York. ${ }^{13}$
D. M. Hall, working at the University of Illinois and in close connection with the state $4-\mathrm{H}$ leaders, has studied health and fitness standings of Illinois $4-\mathrm{H}$ youths for some twenty-one years. ${ }^{14}$ Hall's analysis shows that health consists of four parts --- growth, organic fitness, motor fitness, and body protection. Hall has set up a battery of tests consisting of two endurance tests, two flexibility tests, two speed tests, and three strength tests. The tests have been standardized by sex, age, and by size and weight index. ${ }^{15}$

Dr. Bruno Balke has recently developed a walking treadmill test of
${ }^{12}$ The New York State Physical Fitness Test: For Boys and Gir1s Grades 4-12 (Albany, New York, 1958).
$13_{\text {Blesh }}$ and Meyers, p. 219.

${ }^{15}$ D. M. Hal1, "What is a Good Physical Fitness Program?", The Physical Educator XVIII: 3 (October, 1961), p. 94.
work capacity. This test measured the maximal oxygen intake attainable by the subject while working aerobically. The maximum oxygen intake attainable is described by Balke as the most adequate criterion of work capacity. Dr. Balke has standardized the treadmill test and correlated it with the oxygen requirements estimated for average velocities achieved in best effort runs over various distances. There was a high correlation between distances covered in runs of twelve to twenty minutes duration and the more objective treadmill test. Based on these findings, a field test for the assessment of physical fitness was established which employed a fifteen-minute endurance run. Balke concluded that the run gave a valid objective rating of physical fitness. ${ }^{16}$

Two unpublished field studies were carried out at Oklahoma State University in 1963 dealing with endurance run tests. Using eighty-eight boys and eighty girls in the seventh and eighth grades of Cushing, Oklahoma, Junior High School, Glenn correlated scores of the 600-yard runwalk test and the fifteen-minute endurance run test to determine whether the 600 -yard run-walk test was a valid test for endurance. ${ }^{17}$ Glenn found a definite relationship between the two runs but the correlation was not high enough to validate the 600 -yard run-walk as an endurance test.

Newman carried out a study to establish norms for the fifteen-minute endurance run for Kay County, Oklahoma, $4-\mathrm{HClub}$ members. ${ }^{18}$ The run test

${ }^{18}$ Eva Newman, "An Establishment of Local Norms for the Fifteen-Minute Endurance Run for Kay County 4-H Club Boys and Girls Ages 96-227 Months" (unpub. field study, Oklahoma State University, 1963), p. 1.
was given to forty-six boys, thirty-three girls, age eight to fifteen and forty-one boys and forty girls age sixteen to eighteen. The older boys ran further with a mean of 2,744 yards. Next came the older gir1s with a mean of 2,063 yards. The younger boys' mean was 2,051 yards and the younger girls' was 2,010 yards.

Brown ${ }^{19}$ tested 104 boys from Emerson seventh grade at Enid, Oklahoma, on the fifteen-minute endurance run and compared his findings with those of Glenn and Newman. The boys from Cushing had the greatest mean in distance covered with 1.7 miles. The 104 Emerson boys, age eleven to fourteen, tested by Brown, had a mean of 1.64 miles, and the Kay County $4-\mathrm{H}$ Club boys' mean was 1.6 miles.

In a study by Ray, ${ }^{20}$ trunk flexibility measurements were taken from a group of boys and girls attending a $4-\mathrm{H}$ Club summer camp near Ponca City, Oklahoma, and compared to Cureton's Multiple Rating Scale of trunk flexibility. Ray's measurements were taken from eighty-eight boys and seventyfour girls, age nine to sixteen. The flexibility means taken from the 4-H groups were quite different from the means presented in Cureton's Multiple Rating Scale. The 4-H C1ub members were found to be more flexible. This difference is very probably due to the age difference of the groups. Cureton's subjects ages ranged from eighteen to twenty-four years and the $4-H$ boys' from eleven to eighteen years. It is known that flexibility is generally reduced with age. There may have been a slight
${ }^{19}$ William S. Brown, "A Comparison of Kay County 4-H Meribers, Cushing Seventh and Eighth Grade and Emerson (Enid) Seventh Grade Endurance Run" (unpub. field study, Oklahoma State University, 1964), p. 8.
${ }^{20}$ Howard Ray, "Measuring the Trunk Flexibility of Oklahoma 4-H Club Members" (unpub. field study, Oklahoma State University, 1963), p. 19.
difference due to the point of measurement. Cureton's measurements were made from the floor to the ear lobe of the subject. Ray's measurements were taken from the floor to the chin.

Hetrick ${ }^{21}$ compared standing broad jump means of $1624-\mathrm{H}$ boys and girls to the national means as set up by the AAHPER Research Council. The results showed that the means of the group studied fell consistently short of the national means. The reason for this difference may have been because the subjects studied by Hetrick were given only one trial and the national averages are based on the best of three trials. It was also possible that Hetrick's subjects lacked the proper skill and timing of the arm swing and the jump.

In summary, the procedures employed in the measurement of physical fitness have undergone continual change in this country. Most of the earlier tests were based on measurement of strength, such as the number of sit-ups, chins, or push-ups one could do in a given time. Since Cureton's recognition of the various components of physical fitness, the testing of physical fitness has become more sophisticated. Recent laboratory testing procedures have involved elaborate and expensive equipment which requires much time and highly trained personnel to measure the physical fitness level of even a very small group. This type of laboratory testing is not applicable nor practical for mass testing of large groups by limited personnel and in Iimited time. In his very recent work with the fifteen-minute endurance run, Dr. Balke has developed a simple field test of physical fitness which is highly correlated with more elaborate
${ }^{21}$ Charles Hetrick, "How Do the Scores of The Standing Broad Jump of 4-H Boys and Girls Compare to the National Average?" (unpub. field study, Oklahoma State University, 1963), p. 19.

1aboratory testing procedures.
There is still much to be done in the area of physical fitness measurement. There is a great need for valid and reliable physical fitness tests with adequate standards which can be administered efficiently to large groups.

PROCEDURE

In general, selection of test items used in this study was made on the basis of measurement of the components of physical fitness as described by Cureton. More specifically, the fifteen-minute endurance run was included at the recommendation of Dr . Balke. The other tests were suggested or designed by Dr. A. B. Harrison, Associate Professor of Health, Physical Education, and Recreation at Oklahoma State University with several criteria in mind: ease and rapid measurement for large groups in a station-to-station testing situation, meaningfulness to the subjects being tested, and validity in measuring physical fitness. The forty-yard swim was included because it was the opinion of the director of this study that swimming is an important skill which every child should possess and that this skill could be associated with the individual's fitness level. For each test, a three-point scoring scale was arbitrarily set up so the individuals would have some idea of their rating on each test item.

The following test items were included, along with instructions and scoring procedures.

## Rope Climb

The rope climb was used as a test for strength. The subject was asked to climb as high as he could up a twenty-two foot rope, two inches in diameter. He was instructed to use his hands and feet while climbing.

He started from a standing position and was given one trial.
For scoring purposes, the rope was marked at the nine, fifteen, and twenty foot height. If the subject did not climb nine feet, his score was zero. If he climbed as high as nine feet but less than fifteen feet, his score was one. If he climbed as high as fifteen feet but less than twenty-two feet, his score was two. If he climbed to the top or twentytwo feet, his score was three.

The rope was further divided into one-foot intervals so that a more accurate measurement could be obtained for establishing standards. The subject had to climb to a mark before he was given credit for that height. For example, if a subject climbed ten feet and nine inches, his recorded height was ten feet.

## Balance Beam Walk

When testing balance, the subject was instructed to step onto a balance beam at one end and walk, heel to toe, as far down it as he could without stepping off. The balance beam was fifteen feet long, two inches wide, and eight inches high. If he did not complete at least three steps on the balance beam, he was given another trial.

The balance beam was marked off into three equal lengths. If the subject did not walk one-third of the beam's length, his score was zero. If he walked one-third but less than two-thirds, his score was one. If he walked two-thirds but did not make the full length, his score was two. If he walked the entire length of the balance beam, his score was three.

The balance beam was further divided into one-foot lengths so that a more accurate measurement could be obtained for establishing standards. A drawing of the balance beam used in this test is included in Appendix $B$.

## Flexibility Test

Trunk extension and trunk flexion were used to measure flexibility. To measure trunk extension, the subject assumed a prone position with his hands in the small of his back. He was instructed to raise his chin as far from the floor as possible without jerking. The subject's legs were held down by a partner who placed his hands on the thigh of the subject just below the glutei muscles. Pressure was applied here to keep the subject's hips from raising off the floor. The partner assumed a kneeling position over the subject's heels to hold the subject's feet down.

A sliding caliper was used to measure the distance to which the subject could raise his chin from the floor. The measurements were recorded in inches to the nearest one-fourth inch. If the subject could not raise his chin as high as fourteen inches, his score was zero. If he raised as high as fourteen inches but less than seventeen inches, his score was one-half. If he raised as high as seventeen inches but did not reach twenty inches, his score was one. If he raised his chin twenty inches or more, his score was one and one-half.

To measure trunk flexion, the subject assumed a sitting position on the floor with his legs extended and spread eighteen inches apart at the ankles. His hands were held behind his head. He was then instructed to bend forward, without jerking, and move his forehead as close to the floor as possible. The subject's legs were kept straight by the aid of his partner who knelt at the feet of the subject and pressed down on the subject's knees.

The distance from the subject's forehead to the floor was measured in inches to the nearest one-fourth inch. If the subject's forehead did not get within fifteen inches off the floor, his score was zero. If the
measurement was fifteen inches or less, but not as low as twelve inches, his score was one-half. If the measurement was twelve inches or less, but not as low as six inches, his score was one. If the measurement was six inches or less, his score was one and one-half.

A drawing of the sliding caliper used to measure flexibility is included in appendix $B$. The test of flexibility used in this study is similar to that described by Dr. Cureton in his Physical Fitness Workbook. ${ }^{1}$

## Swimming Test

Each subject was timed individually on a forty-yard swim. The subject was allowed to use any stroke he wished. He started standing in shallow water. The command "get-set----go" was used for starting each subject. On the command "get-set", the subject could grab the scum rail with his hand and place his feet against the end of the pool and prepare for a push-off on the command, "go." Each subject was given time to get into this position. The subject was not given any instruction as to the type of stroke to use or to the type of turn to use at the opposite end of the twenty-yard pool; but, he was told to touch the opposite end. When the command "go" was given, a stop watch was started. The watch was stopped when the subject returned and touched the starting end of the pool. The time was recorded in seconds to the nearest tenth of a second.

If the subject could not swim, if he could not swim the full forty yards, or if his time was more than fifty seconds, he received a score
$1_{\text {T. K. Cureton, Physical Fitness Workbook (St. Louis, 1947), pp. 20- }}$ 21.
of zero. If his time was fifty seconds or under, but not as low as forty seconds, his score was one. If his time was forty seconds or under, but not as low as thirty-two seconds, his score was two. If his time was thirty-two seconds or less, his score was three.

Standing Broad Jump

For this test, a mat four feet by twelve feet was marked off into one-inch lines, parallel to the starting line. The subject stepped onto the mat and stood, toeing the starting line with both feet. He was instructed to jump off both feet as far forward as possible. He was encouraged to swing his arms. If he fell back after jumping, he was given another trial.

The distance jumped, from the starting line to the back of the subject's heels, was measured in inches to the nearest inch. If the subject jumped less than forty-eight inches, his score was zero. If he jumped as far as forty-eight inches but less than sixty inches, his score was one. If he jumped as far as sixty inches but less than seventy-two inches, his score was two. If he jumped seventy-two inches or more, his score was three.

Speed and Agility Run

The subject took his position behind a starting line. He was given the command, "get-set----go." He then ran twenty yards, picked up a block of wood (two inches square) and returned to the starting line as fast as possible. After returning to and touching the ground beyond the starting line, he dropped the block he had picked up and returned back over the same course to retrieve a second block. Upon returning to the starting
line the second time, he ran on past that 1 ine.

When the command "go" was given, a stop watch was started. When the subject passed over the starting line with the second block, the watch was stopped. The time was recorded in seconds to the nearest tenth of a second.

If the subject's time was more than twenty seconds, his score was zero. If his time was as fast as twenty seconds but slower than eighteen seconds, his score was one. If his time was as fast as eighteen seconds but slower than sixteen seconds, his score was two. If his time was sixteen seconds or less, his score was three.

## Fifteen-Minute Endurance Run

For the endurance run, a rectangular one-half mile course was staked out on a grass field. The course was marked off into eighty-eight tenyard intervals. The subjects were started in groups of thirty to fifty and told to go as far as they could in fifteen minutes. They were told to set a pace which they thought they could continue. It was stressed that they should not start out too fast. If they developed a bad sideache, they could slow down and walk it off.

At the finish of each lap, the subjects were given the remaining time left to run. The number of laps completed was recorded by checkers at the starting line. Each subject had a large number pinned on the front of his shorts to prevent any mixup in the number of laps completed in case of some of the subjects were lapped by others.

After the subjects had been going fifteen minutes, a whistle was blown and all the subjects stopped where they were. The distance they had covered was recorded on their number.

If the subject ran less than one mile, his score was zero. If he ran as far as one mile but less than one and one-half mile, his score was one. If he ran as far as one and one-half miles, but less than two miles, his score was two. If he ran two miles or more, his score was three.

A sample of the score card used by each of the subjects will be included in appendix C. See appendix $D$ for subjects instructions.

## General Procedure for Administering Test Battery

The station-to-station testing method was used to administer the tests described above. Each of the tests, except the fifteen-minute endurance run, was given a station number. Station one was the rope climb. One tester was used to test two subjects at one time. Station two was the balance beam walk. Two testers were used to test two subjects at one time. Station three was the flexibility test. Four testers were needed at this station, two to measure and two to record. The subjects were tested two at one time. Station four was the forty-yard swim. Five testers were used with four subjects being tested at one time. Four testers were used to start the subject, time, and record the time. A fifth person was used as a checker at the opposite end of the pool. Station five was the speed and agility run. Two testers were used to test two subjects at one time. Station six was the standing broad jump. The subjects were tested two at one time by two different testers.

A1l of the testers reported to the testing area two hours before the testing was to begin. They were each assigned to a station and instructed individually as to how to administer their assigned test and how to score the subjects. Each tester practiced his procedure on the other testers.

This allowed him sufficient practice at his station and also acquainted the testers with what was being done at the other stations.

The subjects had been previously instructed to bring swim suit, tennis shoes, shorts, $T$-shirts or blouse, a towel and a doctors permit saying they may participate in a testing program of this type. The subjects first reported to an information table where they were given a score card (see Appendix C) and a sheet of instructions. Each subject recorded his name, age, height, weight, and home town on the score card. Pencils were provided at the table for this purpose. The score cards were each numbered in the upper right corner with a number ranging from one to six. This number indicated which of the six stations the subject was to report for the first test. For example, if a subject was given a score card with a number four on it, that subject reported to station four (or the swimming pool). After completing the swimming test, he then reported to station five, six, one, two and three in that order. After completing each of the six tests, the subject reported to the fifteen-minute run area. When the testers finished at their stations they also reported to the run area to help record the distance ran by each subject. The distance beyond the starting line was recorded on the score card which the participants were wearing pinned to their trunks or shirts. The individual's total distance ran was found by adding this distance to the number of laps which he had completed. The score cards were then collected by the testers and the subjects were released.

This procedure provided easy administration of this test battery to as many as one-hundred participants in a two-hour period. It was felt that as many as two-hundred could have been accommodated, if necessary, in approximately two and one-half hours.

Analysis of Data

After a brief examination of the results, the subjects were divided into three groups. The boys were divided into two different age groups because of the difference in performances between the older and younger boys. The boys who were fifteen and older were put in one group and those below fifteen made up the younger group. All the girls were placed into the same group because there was very little difference between the results of the younger and older girls. Means and standard deviations were calculated for each group on all the test items except the rope climb and the balance beam walk. Tables of T-scores and standard scores were set up for all the test items except the rope climb and the balance beam walk.

The following rating scales were devised for the interpretation of the individual's overall physical fitness score.

Older Boys:

| 21 |  |  |
| :--- | :--- | :--- |
| $19 \frac{1}{2}$ | - | $20 \frac{1}{2}$ |
| $18 \frac{1}{2}$ | -- | 19 |
| $16 \frac{1}{2}$ | -- | 18 |

The physical fitness scores of the fifteen best swimmers among all boys were compared with the scores of the fifteen boys who were non-swimmers to test the relationship between the physical fitness level (as measured by these tests) and swimming ability. The scores did not include the swimming score. The means and standard deviations were calculated for the two groups. A t-ratio was calculated to determine significance of difference between the means of the two groups.

The fifteen non-swimmers were also compared to the fifteen poorest swimmers with respect to their physical fitness scores.

The relationship between the swimming speed and the physical fitness level was further tested by correlating the swimming times with the physical fitness scores (minus swim score) of the 111 boys (swimmers) used in this study.

Other comparisons made in this study were:

1. The standing broad jump results of the two groups of Oklahoma $4-\mathrm{H}$ boys were compared with results of the University of Illinois men, Hetrick's results, and the standards presented by the AAHPER Research Council.
2. The trunk extension results of the Oklahoma $4-\mathrm{H}$ boys were compared to the University of Illinois men's results.
3. The trunk flexibility results of the Oklahoma 4-H boys were compared to the results of the University of Illinois men.
4. The fifteen-minute endurance run results of the Oklahoma $4-\mathrm{H}$ boys were compared to the Cushing seventh and eighth grade results, results of Emerson seventh grade of Enid, and Kay County 4-H boy's results.

CHAPTER IV

RESULTS

T-scores and standard scores for trunk extension, trunk flexion, forty-yard swim, speed and agility run, standing broad jump, fifteen minute ednurance run, and physical fitness scores for each of the three groups are presented in Tables I, II, and III. The mean, standard deviation, and the number of subjects for each of the test items are included at the bottom of the tables.

Table IV shows the results of the rope climb. In the rope climb it was possible for a subject to get a perfect score or climb to the top of the rope. This did not result in a continuous distribution of the scores. For this reason, no attempt was made to compute $T$-scores or standard sc scores on this test.

|  |  |  | 68 | 68 | 35 | 66 | 68 | 67 | 37 |

TABLE IV

RESULTS OF ROPE CLIMB (IN FEET)

| Group | Number <br> of Subjects | No. Climbed <br> to Top | Standard <br> Deviation | Mean | Could Not <br> Start Up Rope |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 50 | 47 | 2.42 | 21.25 | 0 |
| Boys - be- <br> low 15 yrs. | 75 | 50 | 3.71 | 19.69 | 0 |
| Girls | 65 | 6 | Not <br> Calculated | Not <br> Calculated | 24 |

Ninety-four per cent of the older boys climbed to the top of the rope. This indicated a high level of arm and shoulder strength among this group. Sixty-six per cent of the younger boys and only nine per cent of the girls climbed to the top. Thirty-seven per cent of the girls could not start up the rope. Part of their problem was that they could not grip the rope tightly enough to hold their own weight and their arms were not strong enough to pull their body up. This indicated a particular weakness of the girls in their hands and arms. There are no standards with which these results can be compared, however, it is believed by the author that the older boys would be above average in arm strength and that the girls lack the desirable hand, arm, and shoulder strength for good fitness.

Table $V$ shows the results of the balance beam walk.

As in the rope climb, no attempt was made to produce standards for the balance beam walk because here again it was possible for a subject to get a perfect score and there was not a continuous distribution of the
scores. Ninety per cent of the subjects walked the full length of the balance beam.

TABLE V
RESULTS OF THE BALANCE BEAM WALK (IN FEET)

| Group | Number of <br> Subjects | Number Walked Total Length | Standard <br> Deviation | Mean |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \text { Boys - } 15 \\ \text { and Older } \end{gathered}$ | 54 | 53 | . 809 | 11.77 |
| Boys - below 15 yrs. | 77 | 71 | 1.98 | 11.45 |
| Girls | 68 | 56 | 2.77 | 10.79 |
| Total | 199 | 180 |  |  |

As measured by this test, the older boys possessed the highest degree of balance. Although this test did not provide a continuous distribution of the scores, it is believed that it was a reliable test of balance. A better spread of scores would have resulted if a more difficult test had been used. A recommended test would be to have the subject walk heel and toe down the beam, turn around, walk half way back, kneel down, stand, and then return to the starting end. As measured by the test used, the subjects rated high in balance ability.

Table VI shows the results of the trunk extension test.
The girls scored best on the trunk extension test. This was expected because girls are generally more flexible than boys. It was also expected that the younger boys would be more flexible than the older boys, however, this was not the case. The older boys scored better on the trunk
extension than the younger boys. This may have been due to stronger lower back muscles possessed by the older boys.

The two groups of boys were compared with the standards for the University of Illinois freshman men students. The Oklahoma 4-H boys possessed a higher level of flexibility. This comparison is shown in Graph 1.

TABLE VI
RESULTS OF TRUNK EXTENSION (IN INCHES)

| Group | Number <br> of Subjects | Best | Poorest | Standard <br> Deviation | Mean |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and O1der | 54 | 24.50 | 10.75 | 3.08 | 17.30 |
| Boys - be- <br> low 15 yrs. | 77 | 21.25 | 6.00 | 2.64 | 16.04 |
| Girls | 68 | 26.75 | 9.75 | 3.31 | 17.75 |

Table VII shows the results of the trunk flexion test. The girls scored best on this test and the younger boys scored better than the older boys. When compared to the University of Illinois freshman men (Graph 2) the $4-\mathrm{H}$ boys were found to be more flexible.

GRAPH I

COMPARISON OF TRUNK EXTENSION SCORES

GRAPH 2

COMPARISON OF TRUNK FLEXION SCORES

## TABLE VII

## RESULTS OF TRUNK FLEXION (IN INCHES)

|  | Number <br> of Subjects | Best | Poorest | Standard <br> Deviation | Mean |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and O1 der | 53 | 4.25 | 17.25 | 3.02 | 10.74 |
| Boys - be- <br> low 15 yrs. | 77 | 4.00 | 18.75 | 3.14 | 10.21 |
| Girls | 68 | 5.5 | 16.25 | 2.54 | 9.56 |

TABLE VIII

RESULTS OF THE FORTY YARD SWIM (IN SECONDS)

| Group | Best <br> Time | Standard <br> Deviation | Mean | Number of <br> Swimmers | Number of <br> Non-Swimmers |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 26.7 | 6.75 | 35.75 | 50 | 4 |
| Boys - be- <br> low 15 yrs. | 30.4 | 6.89 | 40.88 | 65 | 12 |
| Gir1s | 35.8 | 7.49 | 46.00 | 40 | 28 |

Table VIII shows the results of the forty-yard swim. It is the authors opinion that these subjects were below average in swimming ability. Twenty-two per cent of the subjects were non-swimmers. The greatest number of non-swimmers per group was among the girls with fortyeight per cent of the girls being non-swimmers. This lack of swimming
skill is probably due to a lack of swimming facilities in the rural areas from which most of these subjects came.

A comparison was made of the physical fitness scores made by the fifteen best swimmers among the boys and the fifteen boys who were non-swimmers. The fifteen best swimmers had a mean physical fitness score of 15.4 , not including their swimming score. The fifteen boys who were non-swimmers had a mean physical fitness score of 13.17. The t-ratio for the difference of these means was 2.74 . This is significant at the five per cent level. This indicates that the fifteen best swimmers, among the boys, were more physically fit than the boys who were non-swimmers. A comparison between the fifteen non-swimmers and the fifteen poorest swimmers showed the means of physical fitness scores to differ only .03. The fifteen poorest swimmers mean physical fitness score was 13.20 . Using the physical fitness scores and the swimming times of all the 111 boy swimmers, a correlation was computed to determine the relationship between swimming ability and physical fitness scores. The scores did not include the swimming score. The correlation was found to be -.329 which indicates that the lower the swimming time, the higher the level of physical fitness. With this many subjects, this relationships is significant at the one per cent level of confidence. ${ }^{1}$ This gives further justification for including a swim test as part of a physical fitness test battery.
$1_{\text {George W. Snedecor, Statistical Methods (Ames, Iowa, 1957). p. } 174 .}$

TABLE IX
RESULTS OF SPEED AND AGILITY RUN (IN SECONDS)

|  | Number <br> of Subjects | Best <br> Time | Poorest <br> Time | Standard <br> Deviation | Mean |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 54 | 13.6 | 18.7 | 1.16 | 16.08 |
| Boys - be- <br> 1ow 15 yrs. | 76 | 15.0 | 20.0 | 1.03 | 17.08 |
| Gir1s | 66 | 16.2 | 22.8 | 1.36 | 18.12 |

Table IX shows the results of the speed and agility run.
The older boys as a group had the fastest times in the speed and agility run. The younger boys followed and the girls had the slowest times.

To compare the eighty yard speed and agility run used in this test to the AAHPER forty-yard shuttle run, several subjects were given both of the tests and the difference between the individuals times on each test was found. The difference was then added to the national standards for the forty-yard shuttle run and compared to the results of the Oklahoma $4-H$ boys and girls speed and agility run averages. The younger boys had the same average as the national standards after the correction had been made. The older boys and the girls were above the national average.

TABLE X

## RESULTS OF THE STANDING BROAD JUMP (IN INCHES)

|  | Number <br> of Subjects | Best <br> Jump | Poorest <br> Jump | Standard <br> Deviation | Mean |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 54 | 102 | 62 | 9.65 | 80.46 |
| Boys - be- <br> low 15 yrs. | 76 | 94 | 52 | 8.60 | 72.17 |
| Girls | 68 | 86 | 39 | 8.88 | 61.95 |

Table $X$ shows the results of the standing broad jump.
The group with the best standing broad jump score was the older boys with a mean distance of 80.46 inches. The group boys mean was 72.17 inches and the girls was 61.95. When compared to the AAHPER means for seventeen year old boys, the older $4-H$ boys were two and one-half inches short of the national standards. However, the older $4-\mathrm{H}$ boys mean age was not seventeen so this group compared very closely to the national averages. The younger group of $4-H$ boys was compared to the AAHPER averages for thirteen year old boys and their mean distance was seven inches farther than the national averages. Both groups of boys scored higher than the subjects studied by Hetrick. ${ }^{2}$ The older boys had a greater mean distance jumped than the mean of the University of Illinois freshmen men. The boys' broad jump ability was slightly higher than the national averages. See Graph 3 for comparisons.

$$
{ }^{2} \text { Hetrick, p. } 19 .
$$

GRAPH 3

COMPARISON OF STANDING BROAD JUMP SCORES

The girls standing broad jump mean was slightly higher than the national averages for seventeen year old girls. This indicates that the group of $4-H$ girls are considerably above the national average for a similar age group.

TABLE XI
RESULTS OF THE FIFTEEN-MINUTE ENDURANCE RUN (IN YARDS)

| Group | Number <br> of Subjects | Longest <br> Run | Shortest <br> Run | Standard <br> Deviation | Mean |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 54 | 4030 | 1860 | 500.15 | 3271 |
| Boys - be- <br> low 15 yrs. | 75 | 3970 | 1785 | 414.43 | 3046 |
| Girls | 67 | 3005 | 1330 | 347.16 | 2346 |

Table XI shows the results of the fifteen-minute endurance run.
As a group the older boys had the best performance in the fifteen minute endurance run and the girls had the poorest performance. The younger boys mean distance ran was only 225 yards less than the older boys mean. The girls mean was seven hundred yards shorter than the younger boys mean. When compared to Cushing seventh and eight grade, Emerson seventh grade of Enid, and the Kay County $4-\mathrm{H}$ Club boys, both groups of $4-H$ boys in this study were found to be superior in the endurance run. The average velocity per minute was 199.4 meters for the older boys and 185.7 meters for the younger boys. When compared to Balke's

GRAPH 4

COMPARISON OF FIFTEEN MINUTE ENDURANCE RUN SCORES

rating for velocities in meters per minute, ${ }^{3}$ the older boys rated very good and the younger boys rated good. With respect to number of subjects that finished the fifteen-minute endurance run, this was an exceptional group. Only two of the 198 subjects who started the run stopped before fifteen minuteswere up, although many did walk at some time during the run. See Graph 4 for comparisons.

TABLE XII

PHYSICAL FITNESS SCORES

|  | Number <br> of Subjects | Best <br> Score | Poorest <br> Score | Standard <br> Deviation | Mean |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Boys - 15 <br> and 01der | 49 | 20 | 7 | 2.32 | 17.35 |
| Boys - be- <br> 1ow 15 yrs | 61 | 19 | 10.5 | 2.13 | 15 |
| Girls | 37 | 17.5 | 6 | 2.90 | 11.34 |

Table XII shows the results of the subject's overall physical fitness scores as determined by adding the scores of the seven individual test items. When calculating this table, a subject's score was not included if he did not take all the test items.
$3_{\text {Balke, }}$ p. 8.

TABLE XIII
OVERALL PHYSICAL FITNESS STANDARDS

|  | Boys 15 <br> years and over | Boys under <br> 15 years | Girls |
| :--- | :--- | :--- | :--- |
| Classification | 21 | $20-21$ | $18-21$ |
| Superior | $19 \frac{1}{2}-20 \frac{1}{2}$ | $18 \frac{1}{2}-19 \frac{1}{2}$ | $16-17 \frac{1}{2}$ |
| Excellent | $18-19$ | $16 \frac{1}{2}-18$ | $13 \frac{1}{2}-15 \frac{1}{2}$ |
| Above Average | $16 \frac{1}{2}-18$ | $14 \frac{1}{2}-16$ | $10 \frac{1}{2}-13$ |
| Average | $14-16$ | $12 \frac{1}{2}-14$ | $7 \frac{1}{2}-10$ |
| Below Average | $12-13 \frac{1}{2}$ | $10 \frac{1}{2}-12$ | $4 \frac{1}{2}-7$ |
| Poor | $10-11 \frac{1}{2}$ | $8-10$ | $2-4$ |
| Very Poor |  |  |  |

The standards of overall physical fitness scores presented in Table XIII were based on the performance of the $1994-H$ members tested at the 1963 Roundwup. There were a total of 21 possible points on the entire test if the participant made maximum scores on each test item. It is recommended that these standards be used for future testing with this test battery.

## CHAPTER V

## SUMMARY AND CONCLUSIONS

This study was undertaken to administer a battery of tests which would assess the physical fitness level of Oklahoma $4-\mathrm{H}$ Club members and provide standard scores for this group on the tests used. A subproblem was to compare the scores of the Oklahoma $4-\mathrm{H}$ C1ub youths with those of other groups on selected fitness items.

One hundred and ninety-nine Oklahoma $4 \times \mathrm{H}$ Club boys and girls were tested on a battery of seven physical fitness tests. The test items included a rope climb test for strength, balance beam walk for balance, trunk extension and trunk f1exion as a measure of flexibility, forty yard swim test, speed and agility run test, standing broad jump test for leg power, and a fifteen minute endurance run test. For the establishment of standards, the subjects were divided into three groups: older boys - age fifteen and older; younger boys a age below fifteen; and girls. Standards were established for each of the three groups

Based on the results of the seven test items and the comparisons of these results with the results of similar studies, it was considered that:

1. As compared to the national averages established by the AAHPER and results of other studies, the overa11 physical fitness level of the Oklahoma $4-\mathrm{H}$ boys and gir1s appeared to be adequate. There were some strengths and weaknesses evident in the various groups on certain test items.
2. This group showed particular strengths in endurance, flexibility, speed and agility, and weakness in swimming.
3. The boys were above average and the girls below average in strength.
4. The boys and girls rated high in balance ability.
5. All three groups were above average in flexibility.
6. The subjects were, as a group, below average in swimming ability with twenty-two per cent of the entire group and forty-eight per cent of the girls being non-swimmers.
7. The boys and girls were above average in speed and agility.
8. The girls and younger boys were above the national average and the older boys slightly below the national average in the standing broad jump.
9. The boy and girls were above the average of all other groups to which they were compared on the fifteen minute endurance run.

## Recommendations

1. Future studies with the purpose of establishing standards should involve more subjects if possible.
2. Rather than testing subjects who volunteered, more accurate standards would be established if entire groups (i.e., a school population) were tested. A representative group such as this would be more likely to include the entire range of possibilities of a normal distribution.
3. It is recommended that the strength test be revised to include a rope climb to be timed.
4. It is recommended that the balance test be revised and made more difficult so that a more continuous range of scores would result. A recommendation would be to have the subject walk heel and toe down the beam, turn around, walk half way back, kneel down, stand, and return to the starting end.

APPENDIX C

SCORE CARD

## APPENDIX D <br> 4-H Fitness Clinic, Instruction

This clinic program will consist of a series of seven physical fitness tests, by means of which we hope to assess your present physical fitness level. On arriving at this clinic you will receive this instruction sheet and a score card. In the upper right hand corner of the score card you will find a number (from 1 to 6) indicating your first station. Report directly to this station and be prepared to participate in the first test. At this first station fill in the information blanks on your score card with your name, age, ht, wt., etc. Give your score card to the recorder at each testing station. As soon as you have finished the test and your score has been recorded, take your score card with you and proceed to the next station. Report to stations in order of their numbers, 1 through 6 (from 6 go to 1) until you have finished a.ll of the first six tests. Then report to the endurance run station which is located just across the street North from the football stadium. You will need to go around either end of the stadium to reach this station Stations 1, 2, and 3 will be upstairs in the 01d Gym, station 4 will be in the pool, stations 5 and 6 will be located on the lawn across the street South from the Old Gym.

Most of the test procedures will be self-explanatory, however, brief instructions will be given at each testing station. Following are a few instructions regarding some of the stations:
A. Rope Climb - You may climb the rope with hands only or you may use your feet and legs to pull yourself up. Do no slide down the rope as you may get rope burns on the hands.
B. Flexibility - You will need to warm up before doing this event
by doing some bending and stretching while you are waiting.
C. Swimming - If you cannot swim in deep water, skip this station and go to Number 5. If you are not sure of your swimming ability go to the pool, take one of the outside lanes and tell the person timing that you may need help. This test will consist of a forty-yard swim, or two lengths of the pool using any stroke or combination of strokes that you desire. Dressing Rooms, Girls will enter their dressing room from the outside Southeast door of the Old Gym. Boys will enter their dressing room from the central corridor on the ground floor of the 01d Gym. Everyone take a soap shower before entering the pool. Take your score card into the pool with you and hand it to one of the timers at the North end of the pool. On finishing your swim, dry your hands, pick up your score card, go the dressing room, get back into your gym clothes and proceed to Station 5.
D. Endurance Run - The purpose of this test is to see how much distance you can cover in fifteen minutes. It is a test of your endurance ability or your ability to keep working over an extended period of time. This is not to be a fast race like a 100 yard or a 440 yard run. Do not start out at a fast pace but try to establish a nice easy running pace that you feel you will be able to keep up for fifteen minutes. If you need to slow up or walk during the fifteen minutes of course you may, but try to keep running if you can. If, during the last few minutes of the run you still have lots of energy left then speed up the pace to get as far as you can. At the end of the fifteen minute time period a gun will be fired. When you hear the gun, stop running and stand, sit or walk around in the immediate area until one of the recorders comes along to record your score. After you run score has been recorded you will be
through with the testing program and may return to your room for a shower and to change clothes.

Your Fitness Scores - Of course, you will be interested in knowing how you rate on the various tests and your overall rating. On your score card at each station the recorder will circle a number ( $0,1,2$, or 3 ). These circled numbers will give you an indication of how well you did on that event. 0 and 1 are poor, 2 is average, and 3 is above average. If you want to keep track of your total points for the test then add your total after your endurance run score has been recorded, you can check your overall rating according to the following scale: 19-21 excellent, 15-18 average, 12-14 below average, 8-11 poor. More specific standards for each event and for the overall rating will be worked out after all of the test scores have been complled and these standards will be made available to you through your 4-H leaders.

Warren Ray Graham<br>Candidate for the Degree of<br>Master of Science

Thesis: A STUDY OF PHYSICAL FITNESS OF OKLAHOMA 4-H CLUB MEMBERS

Major Field: Health, Physical Education, and Recreation
Biographical:
Personal Data: Born near Wayne, Oklahoma, July 10, 1939, the son of James Lee and Mary Evelyn Graham.

Education: Attended elementry, junior and senior high school in the Tulsa Public Schools, Tulsa, Oklahoma; graduated from Will Rogers High School in 1958; received the Bachelor of Science degree from Oklahoma State University, with a major in Health, Physical Education, and Recreation, in May, 1963.

Professional Experience: Graduate Assistant, Department of Health, Physical Education, and Recreation, Oklahoma State University from January, 1963 to June, 1964. Member of the American Association for Health, Physical Education, and Recreation; member of Phi Kappa Phi.
