## FOREWORD

Prices have been a vitally important factor affecting the well-being of Oklahoma farmers since before statehood. A national commercial agriculture, based on production of farm commodities for sale to obtain income to purchase other goods and services, already existed before the opening of western Oklahoma for settlement. Consequently, almost since agriculture became established as an important Oklahoma industry, farmers in this State have been dependent upon and concerned with prices received for farm products sold, and prices paid for other products bought. The extreme, and rapid, changes in the level for both types of prices since the beginning of the World War have emphasized and increased the importance of prices as a factor determining the income and well-being of Oklahoma farmers.

The enactment of the Agricultural Adjustment Administration Act climaxed a period of growing recognition by farmers and other groups in the American national economy that prices are vitally significant to agriculture. During the succeeding years of evolution in agricultural planning, prices and price relationships have continued to be fundamental to the problem. So vital are price considerations to the whole field of agricultural planning that it may be safely said that lasting progress depends primarily on proper understanding and use of the principles governing price relationships. The emphasis on farmer control of planning places a premium on such understanding by farmers and their leaders.

This publication has for its purpose the supplying of as complete and accurate price data as are available for the principal Oklahoma farm commodities. These data, presented by months as before, supercede and bring up to January 1939 those previously published by Lippert S. Ellis in the *Supplement to Current Farm Economics* of the Oklahoma Agricultural Experiment Station. There has been some refinement and improvement of the index numbers.

Most of the basic data used in the construction of the index numbers were obtained from price and income reports published by the Division of Agricultural Statistics, Agricultural Marketing Service, United States Department of Agriculture. Unpublished data in the files of the Federal Crop Reporting Board, Washington, D. C., were obtained for some items, including revisions of wholesale milk prices, butterfat, peaches, and pears.

Monthly price data for some commodities in early years were lacking and a large amount of research was necessary to secure authentic data, use being made of newspaper files and dealers' records to obtain prices of sheep and lambs, mules, grain sorghums, and cottonseed for some early months.

No attempt has been made in this bulletin to analyze or interpret the price movements shown. Analysis and interpretation of the data will be presented at an early date in another publication.

This publication constitutes a source book for the use of county agents, vocational agriculture teachers, farmers and others needing such information.

Current monthly figures for all prices and index numbers appearing in this bulletin will be published in **CURRENT FARM ECONOMICS**, issued bi-monthly by the Oklahoma Agricultural Experiment Station

# Oklahoma Farm Price Statistics, 1910-1938\*

By Trimble R. Hedges and K. D. Blood

## SECTION I INTRODUCTION

### MOVEMENTS OF OKLAHOMA FARM PRICES 1910-1938\*\*

Since 1920, the price trend for all classes of Oklahoma farm products has been downward. During the years 1910 to 1915, the general direction of grain and cotton and cottonseed prices was also downward, while meat animal, dairy products, and poultry products prices moved upward. (Figure I, see cover page). Between 1915 and 1920, as a result of conditions accompanying the World War, there was a tremendous upward surge of prices for all types of farm commodities. Cotton and cottonseed prices rose from a level somewhat below the 1910-1914 average in 1915 to two and one-half times the 1910-1914 average in 1919. Other groups of commodities started at slightly above the 1910-1914 level in 1915 and reached peaks varying from two to two and one-quarter times the 1910-1914 level. Not all commodities reached their peak at the same time. For grains, cotton and cottonseed and meat animals, the peak was reached in 1919; while the peak for poultry and dairy products was reached in 1920. Obviously, such extremely high prices were insubstantial and resulted only from the very unnatural conditions which accompany a war. Among these are inflation, restricted market supplies, increased foreign demand, and speculative fever.

Following the war came the price recession of 1920 and 1921. Cotton and cottonseed suffered the sharpest drop, but recovered quickly to a secondary peak fairly well maintained during the early 1920's. (Figure I.) Prices for meat animals dropped to the pre-war level and remained there until the mid-twenties, while grain prices also underwent an extremely sharp drop but recovered earlier than the meat animal prices. Poultry and dairy products failed to decline as sharply as other commodities, but also underwent less price recovery following the recession of 1920.

There was distinct variation among the groups of commodities in the time of inception of the price decline of the late twenties and early thirties. Cotton prices made a sharp decline during the mid-twenties, reached another peak in 1928, then declined steadily until 1932. An uninterrupted decline characterized grain prices from the peak in 1925 until the low in 1932. The sharp decline of the Great Depression began in 1929 and was terminated in 1933 for meat animal and poultry products, and in 1932 for dairy products. The depth of the decline was greater for cotton, cottonseed, and grains than for any of the livestock commodity groups. From 1932-33 until the end of 1937, the grains and the livestock groups each recovered in

\* Statistical work supervised by Wenfred Ray and Marjorie Hill. Research to secure price data for early years and computation of weights made by C. E. Burkhead, Assistant Statistician, United States Department of Agriculture, Agricultural Marketing Service, Division of Agricultural Statistics, Oklahoma City, Oklahoma.

\*\* See *Current Farm Economics* for current prices and index numbers.

about the same proportion to slightly above the pre-war level. Prices for cotton and cottonseed reached a post-depression peak in 1935, and later declined until in 1937 they were somewhat below the pre-war level. All farm prices dropped from 1937 to the end of 1938, with the sharpest declines in the grains and cotton groups.

#### METHOD OF CALCULATION OF INDEX NUMBERS

The indexes previously constructed by Lippert S. Ellis\* have been recalculated according to procedure recommended by the Agricultural Marketing Service in order to make indexes for Oklahoma more readily comparable with indexes for other states, and for the United States as a whole. The method involves the calculation, first, of an index for each of the 25 individual commodities, second, an index for each of the groups of commodities (grains, meat animals, dairy products, etc.), and, third, an index for the combination of all 25 commodities.

Calculation of the index for each of the individual commodities involves the following steps:\*\*

(1) Multiplying the base price for the commodity (average of 60 months, 1910-1914) by the weight or base quantity (average annual marketings for the six years 1924-1929), to obtain a base value in terms of dollars.

(2) Multiplying the current price by the base weight (as used in Step 1), to obtain a current value for the commodity.

(3) Dividing the current value by the base value.

(4) Multiplying the result by 100, to obtain an index or price relative.

#### EXAMPLE

##### Method of Calculating Indexes.

I	II	III	IV	V	VI	VII
Commodity	Base Price (Dollars)	Weight (1,000 Bushels)	Base Value (II×III) (\$1,000)	Current Price (Dollars)	Current Value (Dec. 1938) (III×V) (\$1,000)	Index (VI÷ IV×100)
Wheat	.86	45,703	39,305	.52	23,766	60
Corn	.65	11,240	7,306	.45	5,058	69
Oats	.45	5,662	2,548	.27	1,529	60
Group			49,159		30,353	62

Price indexes for groups of commodities† are obtained by:

(1) Totalling the base values. (Found, for each commodity, by Step 1 above.)

(2) Totalling the current values. (Found by Step 2 above.)

(3) Dividing the total of the current values by the total of the base values.

(4) Multiplying by 100, to obtain the current index for the group of commodities.

\* *Oklahoma Farm Prices*, Supplement to CURRENT FARM ECONOMICS, Oklahoma Agricultural Experiment Station, Stillwater, 1933.

\*\*Understanding of this description of the method used in calculating the indexes will be facilitated by reference to the example given above and to Figure II, which is a facsimile of one of the work sheets used in making the calculations.

† As, for example: Grains—Wheat, corn, oats, barley, rye, and grain sorghums.

Index of price paid by Farmers for commodities purchased

11. Estimate \_\_\_\_\_

12. Final \_\_\_\_\_

**Figure II. Price Index Work Sheet Used in Calculating Indexes of Oklahoma Farm Prices.** The monthly all-commodity index of Oklahoma farm prices is obtained by combining the fifteenth of the month prices for the 25 most important products according to a weighting system designed to allow each product approximately its proper share of importance in the final index.

The index for all Oklahoma farm commodities was obtained by:

- (1) Totalling the base values for each separate group of commodities.
- (2) Totalling the current values for each separate group of commodities.
- (3) Dividing total current values by total base values, and
- (4) Multiplying the result by 100.

Weights were used in constructing the group index numbers because all farm products are not equally important sources of income to Oklahoma farmers. Only through use of weights could the relative importance of individual products in the index be adjusted roughly to their relative importance as sources of income to Oklahoma farmers as a whole.

The 1910-1914 period was used as the base for constructing the index numbers for the same reason as that give above for revising the index numbers, namely, in order to make them comparable with index numbers for other states and the United States as a whole. The significance of using this base period will be pointed out in the following section. Since no comprehensive data are available for computing an index of prices paid by Oklahoma farmers, indexes of prices paid by all United States farmers were used in computing the purchasing power of prices received for Oklahoma farm commodities. Indexes of prices for individual commodities and groups were each divided by the index of prices paid by United States farmers for the same period. (The index of prices paid by United States farmers is also on a 1910-1914 base.)

#### RELATIONSHIP OF OKLAHOMA AND UNITED STATES FARM PRICES

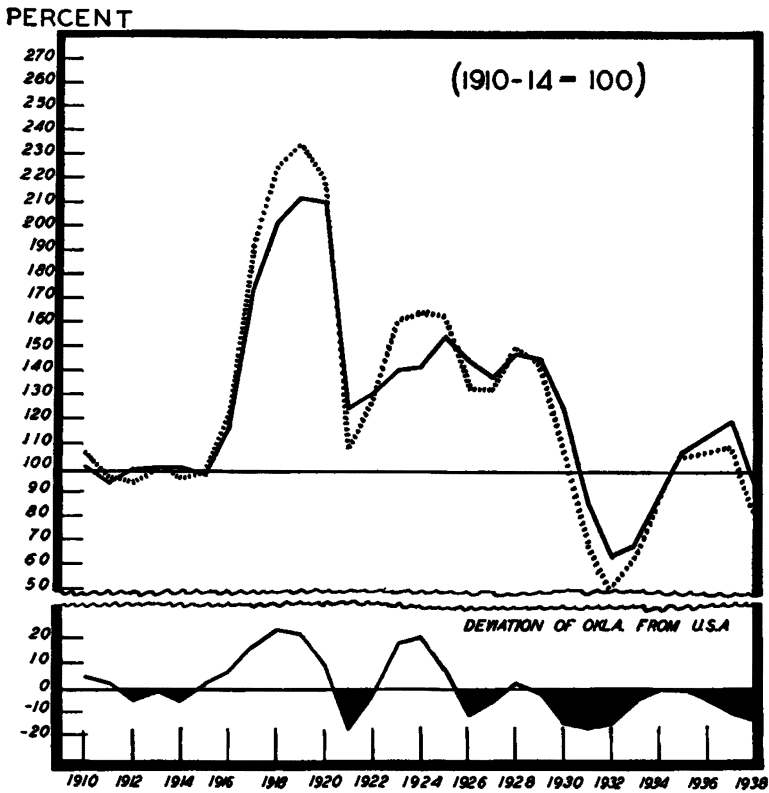

Oklahoma farm prices were above the level of United States farm prices in terms of 1910-1914 as base during most of the period from 1910 through 1925. (Figure III.) Exceptions were the years 1912, 1914, 1921 and 1922. It was pointed out above that these were years of declining prices for two groups: cotton and cottonseed, and grain. The wartime stimulus to these commodities caused Oklahoma prices to exceed United States prices by a wide margin (10 to 20 percent) during the war years and early 1920's. Since 1925, Oklahoma prices have been higher than United States prices only one year, 1928. This, again, resulted from a rise in cotton prices accompanied by prices for the grain group well above the base period average. The sharp price rise of 1934 brought Oklahoma farm prices to an equal level with those for United States as a whole. During all other years, Oklahoma farm prices have averaged lower than those for the United States as a whole. The dominance of grains and cotton and cottonseed groups, commodities the bulk of which must be shipped from the State, in the total index of Oklahoma farm prices is chiefly responsible. Cotton and cottonseed account for 46 percent of the total value in the all Oklahoma farm commodity index at 1910-1914 prices, while grains represent an additional 22 percent.

#### RELATIONSHIP OF FARM PRICES TO PRICES FOR NON-FARM PRODUCTS

The relationship between farm prices and prices of goods bought by farmers is usually shown through use of index numbers. For the years since 1910 the Agricultural Marketing Service has made available a series of index numbers (recently revised) for prices of goods used by farmers in living and production.\* As pointed out above, this index was used in computing indexes of the purchasing power of farm prices received by Oklahoma farmers.

..... Oklahoma farm prices.  
 ——— United States farm prices.

**Figure III. Relationship of Oklahoma and United States Farm Prices, 1910-1938.** Oklahoma farm prices ruled above those for the United States in terms of a 1910-1914 base during most years before 1926; below since 1926. Relatively high prices for cotton and cottonseed and grain during the early years and relatively low prices for these commodities during the later years largely explain the changing relationship of Oklahoma and United States prices.

One point frequently overlooked which is vital to proper understanding of relationships shown by index numbers is that the relationship of prices during the years selected as the base affects relationships during all other periods for which comparisons are made. The relationship during all other years both before and after this assumed "normal" is automatically expressed in terms of the base period relationship. Hence, if the period relationship is not typical it may be a source of considerable error by users of the index numbers who take it for granted that price relationships during the base period are typical. This is, of course, as true of index numbers calculated on a 1910-1914 base (the base used in this publication) as it is of index numbers calculated on any other base period. The necessity for proper understanding of the significance of the base period obtains for any base period used.

Vastly different results are shown if some other base period is used instead of the 1910-1914 base. For the purpose of showing this difference, the price of United States farm products has been compared with the United States price of commodities other than farm products and foods.\* (Figure IV.)

When these two series of index numbers are compared on a 1910-1914 base, that is, the base period used in preparing index numbers in this publication, the following results may be seen:

(1) For comparative purposes, prices for both farm products and commodities other than farm products and foods are considered as normal or equal to 100 percent on the average during the years 1910-1914.

(2) Farm products were relatively higher than the other groups of commodities from 1916 until 1919 and from 1927 until 1930.

(3) Prices for farm commodities were relatively lower than other commodities from 1919 to 1927 with the single exception of the year 1925.

(4) They were also relatively lower from 1930 through 1938.

(5) United States farm prices were relatively lower than prices for farm products and foods from 1880 until 1910. This is an especially noteworthy point in light of the general acceptance of 1910-1914 as a period of "normal" price relationships.

Different results are obtained when the years 1905 to 1909 are used for the base instead of 1910 to 1914. These results are:

(1) The relationship between prices for farm products and products other than farm products and foods during the years 1905 to 1909 is considered normal and averaging 100 percent.

(2) Farm prices are relatively higher than prices for other commodities from 1908 until 1920 and from 1923 until 1931 and during 1935, 1936, and 1937.

(3) Furthermore, farm prices are slightly higher relatively than prices for non-farm products and foods during the years 1891 through 1894, and the individual years 1902 and 1904.

(4) The only years during the entire period when farm prices are sharply lower relative to the prices for non-farm products and foods are the years 1880, 1886, 1889, and from 1931 to 1934.

These results may be summarized thus: If the years 1910-1914 are taken as those during which the average relationship between prices for United States farm products and United States prices for non-farm products and foods were typical or "normal," the farmers have been at a price disadvantage during all the years between 1880 and 1936 with the exception of ten. On the other hand, if the price relationship prevailing between these two

\* The latter index was selected because data are not available prior to 1910 for the selected groups of commodities used in farm living and production.

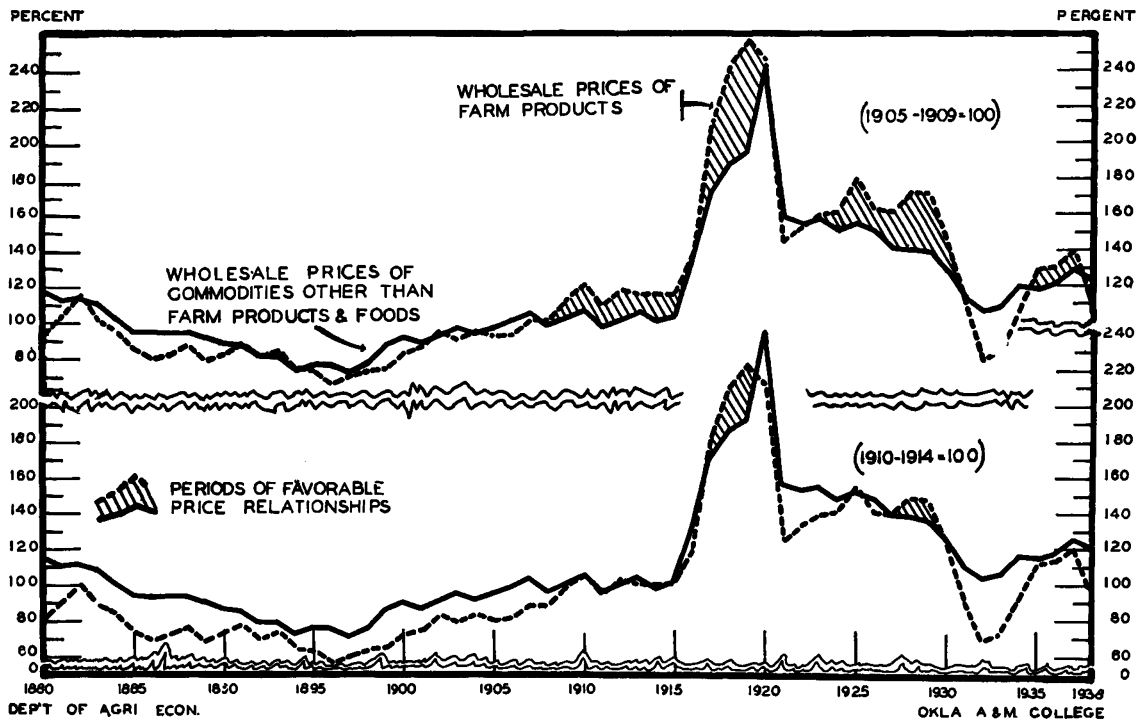

Figure IV. Relationship of United States Farm Prices and Prices of Non-Farm Commodities and Foods in Terms of 1910-1914 and 1905-1909 base, 1880-1938. Price relationships during the base period are highly significant in determining price levels for other periods when index numbers are used for comparison of prices for various commodities.

groups of commodities from 1905 to 1909 is considered typical or "normal," (1) the farmers have been at a price disadvantage only about half of the period 1880 to 1936, (2) have had a distinct price advantage during the other half of the period, and (3) this price advantage has averaged greater than the price disadvantage during years when the disadvantage existed.

The obvious conclusion is that in all probability neither of these sets of conclusions is correct. It is not possible to point to either of these five-year base periods as representing typical or "normal" relationships. Regardless of which period of years is selected as the base, index numbers constructed on this base can only express relative prices for other periods in terms of price relationships during the base period. People using index numbers should remember this, and consider a base period as a mathematical device for convenience in showing relationships, not as a measure of social justice or fairness in relative prices at other periods.

#### PURCHASING POWER OF OKLAHOMA FARM PRICES

Expressing Oklahoma farm prices as a percentage of prices paid for other commodities is a useful method of indicating in a very general way relative changes in the amounts of other commodities used by farmers which farmers may obtain for an average unit of Oklahoma farm products at various times. As was true of prices, the purchasing power of prices for the

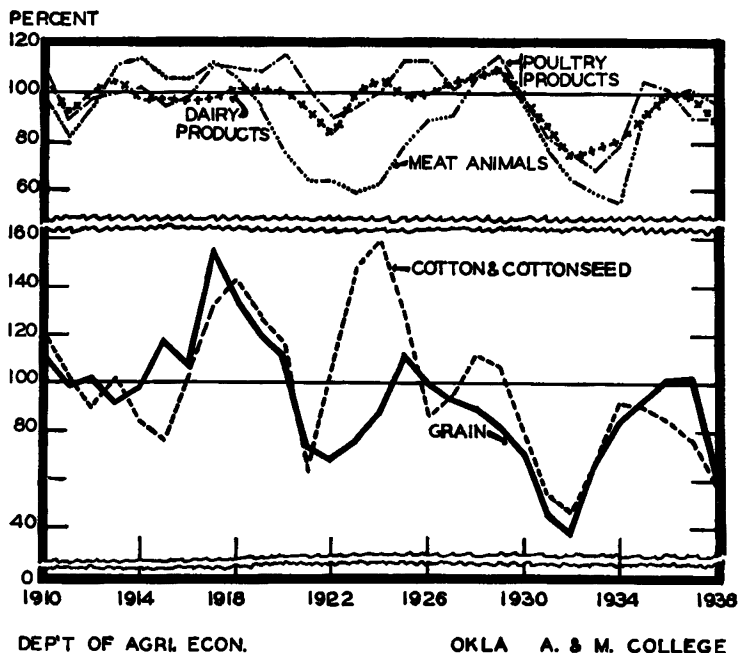

Figure V. Purchasing Power of Indexes of Prices for Groups of Oklahoma Farm Commodities, 1910-1938. Purchasing power of cotton and cottonseed and grain prices fluctuated most widely during the period. The purchasing power of meat animal prices varied most widely among the livestock groups.

grain and the cotton and cottonseed groups fluctuated much more violently than the index of purchasing power for any of the livestock groups during the period from 1910 through 1938. (Figure V.) Among livestock groups, the index for meat animals fluctuated more widely than other indexes. From 1910 to 1929, poultry products and dairy products closely followed the base period relationship in purchasing power. During this same period the grain group index and cotton and cottonseed varied from 50 percent above their base period purchasing power during the war years to 30 percent below in 1921. The cotton group also reached a level of 50 percent above the base period during 1923 and 1924. Since 1929, all three indexes in the livestock group have described about the same course, with meat animals reaching a lower level of purchasing power than the other two indexes. Again the grains and the cotton and cottonseed groups reached a much lower level than indexes included among the livestock groups, and reached this level in 1932 as compared with 1933 for poultry products and 1934 for meat animals.
