## ACKNONLEDGMBNT

The writer wishes to express his appreciation to all who have had a part in this study, and he is particularly grateful to the following: To Mr. C. C. Dunlap, President of Eastern Oklahoma College, at whose suggestion the study was made; to the faculty of Eastern Oklahoma College for their cooperation in gathering data; and to Dr. M. R. Chauncey, Dr. J. C. Muerman, and Dr. Haskell Pruett for their encouragement, valuable suggestions, and careful criticisms.

A SIUDY OF THE STUDENTS, CURRICULUM, AND ADJACENT COUNTIES
OP FASTERN OKLAHOMA COLLEGE

Chapter I
INTRODUCTIION

As on institution the junior college is almost entirely a product of the present century, developing for the most part since 1900, and receiving the encouragement of the colleges and universities. Many of its fundamental problems, however, still remain unsolved, and attempted solutions of these problems with respect to support, administration, and status vary widely in the different states.

The junior college has come to be considered by many as a distinct and necessary unit to our system of education. However, with all its importance, it has not been allowed to pioneer a great deal, its organization and ourriculum having been dictated largely by the institutions of higher learning. Beoause of its youth it was not well established, and to make itself secure it was necessary to take steps toward gaining prestige. This was done by offering preparatory work for senior colleges, and making this work as nearly as possible of the same type as that of the higher institutions. When a junior college gave evidence of fulfilling the minimum requirements of the colleges and universities of meriting hour-for-hour oredit when students transferred, then it was ready to take its rightful place in the sun.

During the past few years, however, the junior college has become 1
W. J. Greenleaf, Junior Colleges, U. S. Office of Education, Bulletin, 1936, No. 3.
more firmly set in the scheme of things, and much work is being done along the line or reorganization of curricula. This reorganization has not been limited to junior colleges, but many colleges and universities of the country as well are attempting reorganizations in their lower division work. Three schools having made significant moves of this nature are the University of Chicago, University of Minnesota, and University of Indiana. The urgent need for such a move is brought out in the statement of H. P. Rainey:

Our studies show, first of all, that there is almost no relationship between the types of training which youth receive and the jobs which they enter. Some of the studies that have been made show as high as seventy percent of these out-of-school youth who are not trained for any skilled job, and as high as forty percent who are not trained for any kind of a job.

In the second place there is at present a great deal of confusion among educators relative to the function of schools toward vocational education and of the relation between general and vocational education. The fact that seventy-five percent of all youth are out of school at ei chteen years of age is very significant for secondary education. Coupled with this is the further significant fact which we have discovered that there has been a steady trend since 1910 to exclude youth under twenty-one from employment. Thus today there is a steadily widening gap between the completion of school on the one hand, and the beginning of employment on the other, for an increasing percentage of our youth. $2^{2}$

The trend as to reorganization at higher institutions is concerned
largely with general education, while many of the junior colleges are making steps toward both general education and vocational or semiprofessional courses. The general feeling of university administrators
is expressed by the following statement:
In the last decade a basic theory of college education has been put before us more and more frequently and with increasing forcefulness. This theory may be stated briefly as follows . . . Though a student who enters college with a well-defined educational and perhaps vocational aim should be given the opportunity and be

2
H. P. Rainey, "The Needs of Youth at the Junior College Level," Junior College Journal, Vol. V, No. 8, p. 426.
encouraged to pursue that aim from the beginning of his freshman year, the major emphasis in the junior-college years should be placed upon breadth of general education; and though general education should continue in senior college, the major emphasis of the last two years should be upon concentration in, and depth of penetration of, some particular field of thought. ${ }^{3}$

The feeling most often expressed by junior eollege authorities
is given in the statement of W. C. Eells:
With the popularization and more general recognition of the idea that the junior college is the completion unit of general education, that it is the college for all the people and not for those alone with university espirations, is coming the necessity of the broadening and adjustment of the curriculum to include a wide variety of terminal courses of various types, some semi-professional in nature, sone more purely oultural and eivic. ${ }^{4}$

U A study of Junior Colleges in California, made by the Carnegie 5
Poundation, recommended that a curriculum be devised to give the student about to complete his general education a unitary conception of our developing oivilization. This curriculum, it was stated, should be provided in all institutions offering education on a junior college level. It should be the most important curriculum, inasmuch as it aims to train for social citizenship in American civilization. A further recommendation was that a group of specialized vooational curricula more advanced than those given in high school should be offered, aimed to care for the needs of those registrants who probably would soon terminate their sohooling. The content of these courses would be determined by vocational or semiprofessional opportunities offered by the state or region. /

Purpose of Study
It was with the question in mind of the suitability of the curriculum to the needs of the students that this study was begun. The writer felt that in Easterm Oklahana College, and likely in the other junior colleges of the state also, the curriculum being offered was not entirely suitable to the needs of a large percentage of the students. The administration of Eastern Oklahoma College is oognizant of this fact, and already steps are being made to remedy this situation by means of additional vocational courses.

The study has been taken up with a brief comparison of the purposes and curricula of the state-supported junior colleges. This having been done, a study of the students of Eastern Oklahama College was made in order to determine their abilities, their home situations, their vocational interests, and the possibilities of their continuing training in a four year college. In order to complete the study, the writer felt also that an investigation should be made of the home counties from which the students come, and to which they probably will return after leaving school.

## The Need

Since there are thousands of youths over the state not in school, and many of those in school will never be able to attend four years of college, then a curriculum set up to accomodate only those wishing pre-four year college work is not adequate. That this limited educational service is failing to meet the needs of the people is attested in the very large withdrawal, before or by their sophomore year, of the freshmen enrolled in the colleges all over the country, and by the fact that the greatest enrollment in commercial colleges of the country is of high school
graduates. The effort will be made to determine whether or not this same need is found in the enrollment of Eastern Oklahoma College. Method

The comparison of the seven state-supported junior colleges was made from two principal sources. The purposes and aims of the schools were taken from the Session Laws of the Oklahoma State Legislature, and the data for comparisons of curricular offerings were obtained from the General Bulletins of the Colleges.

The students of Eastern Oklahana College were studied through three media: a questionnaire was filled out by the students, an intelligence test was given them, and in some instances a personal knowledge of the student was used. Those students who were not available for the test and questionnaire were studied by means of records in the office of the registrar.

The student questiomaire was given in order to find out the vocational interests of the students, the home situations (number in family, educational status of members of family, whether or not parents are living, educational opportunities, etc.), and to learn the parents* occupations and their abilities to finance the student through further college work. The vocational interests of the students could thus be compared with the parents' oscupations, and the chance for further education of the student, if it were necessary in that chosen vocation, could be determined.

The Detroit Advanced Intelligence Test was adninistered so that an estimate of the student's ability could be had, and in this way the advisability of his continuing training in the field of his choice might be determined. The large proportion of students in our secondary
schools choosing the professions, and especially the professions of higher prestige, suggests that too frequently only the desirability of the occupation is considered. A consideration of at least equal importance is the oapacity which the student brings to his work.

Both the educational and the vocational plans of students should be considered with reference to their axpacities and interests. Highly aapable students with low-order ambitions should be stimulated, and students with little ability and high ambitions should be challenged to consider seriously their inability to achieve in their chosen 7 fields.

Information relating to the area served by Eastern Oklahoma College was obtained from the Bureau of Census, Washington, D. C. This information was necessary in studying the students and in adjudging the curriculum as related to the students ${ }^{*}$ present needs.

## Chapter II <br> CURRICULA AND PURPOSES OF STATE-SUPPORTED JUNIOR COLLEGES

In an effort to campare the purposes and curricula of the other six state junior colleges with the purposes and currioula of Eastern Oklahoma College, the brief comparative study of this chapter is presented.

This study is not at all intended to be comprehensive, but it has been done to furnish a setting for the more intensive study of Bastern Oklahoma. College wich is to follow. The purposes of each school as set forth by legislative act have been taken and compared with the curricula which are offered at the respective colleges. Purposes of Junior Colleges

As a preliminary to the study of purposes of Oklahoma Junior Colleges, mention should be made of the extensive, nation-wide survey 1 of junior college purposes made by D. S. Campbell. The study is discussed here in order to relate the Oklahoma schools with colleges over the country.

A resume of this nation-wide survey is given below. The eleven purposes most frequently mentioned and the percent of college catalogues in which they appeared were as follows:

1. Preparation for college or university ..... $43 \%$
2. Give individual attention to students ..... 32
3. Boonomy of time and money ..... 29
4. Provide smaller classes. ..... 22
5. Continue home influences. ..... 22
6. Provide oceupational training ..... 21
1D. S. Campbell, "A Critical Study of the Stated Purposes of the JuniorCollege." George Peabody College, Nashville, Tenn.
7. Provide suitable try-out for college........... 18
8. Offer completion education.......................... 14
9. Develop leadership.......................................... 12
10. Further training for high school graduates.... 12
11. Meet local needs....................................... . . . 10

This study shows that almost half of the junior colleges were operated for the purpose of preparing students for senior colleges, twenty-one percent were operated to give occupational training, and only ten per cent were endeavoring mainly to meet local needs. Further reference to this study will be made in a later section of this chapter.

The next several sections of this chapter deal with the establishment and purposes of the state junior colleges.

Oklahoma Military Academy
The school at Claremore was originally established by act of the second state legislature, its name being "Eastern University Preparatory School." In 1919, however, the school was renamed, 2
"Oklahama. Military Academy." The act of 1919 stated the purpose of the school as follows:

Character of school--The said Oklahoma Military Academy shall be known and designated by the name of the Oklahoma Military Acadomy, and shall be a school of secondary grade. The curriculum for the school shall include vocational education and military training. The vocational education herein provided shall be confined to the vocations of auto-mechanies and building trades and shall be below college grade. ${ }^{3}$

Two years of college work were made lawful by legislative act

```
2
    Session Laws, OkIahoma, 1909, H.B. 362.
3
Tbid., 1919, page 219.
```

In 1924, but the educational purposes were not fully outlined in the statutes.

University Preparatory School
The University Preparatory School was established by legislative 5
act in 1901, and the junior college department was added in 1920.
The purpose of the school was stated in the following manner:
Purpose--The purpose of such school shall be to provide instruction for the students of Oklahama, which will prepare said student for a university course of study. ${ }^{6}$

The reopening of the school in 1919 set forth the following functions:
Course of study-All courses of instruction given in the University Preparatory School shall be vocational, with the intention of preparing the student for efficient partioipation in same branch of industry, and shall embrace such subjects as bookkeoping, shorthand, typewriting, banking, salesmanship, and business efficiency, and such other business courses as may be recamended by the State Board of Education, and such as shall meet with the approval of the Federal Board of Vocational Education. In addition to the purely vocational instruction, the courses shall include English, mathematios, science, history, and such foreign languages as the Board of Education may direct; all such purely academic instruction to be within the scope usually covered by institutions of secondary grade. But no student shall be permitted to graduate from said school who has not completed one or more of the strictly vocational courses provided. ${ }^{7}$

Northeast Oklahoma State Junior College
Originally established in 1919 and named "Miami School of Mines," the Northeast Oklahoma Junior College received the name it now bears 8
in 1924 by authority of Senate Bill No. 64. The legislative act

```

```

which changed its name stated its purpose as follows:
Board of Regents.---subjeots of study.--The Board of Regents of the Northeastern Oklahoma Junior College shall determine the subjeots of study, which shall be limited to those suitable for the first two years above highschool graduation, except that field courses in mining and geological engineering for advanced students in the College of Engineering of the University of Oklahoma may be maintained. The subjects of study authorized for the Northeastern Oklahoma Junior College, shall be those designed to serve best those students who do not expect to continue beyond junior college work and the professional school of the University of Oklehona or other institutions of higher learning. 9

## Comnors State Agricul tural College

The Connors State Agricultural College was established in 1908 by the first legislature and in 1924 was advanced to the rank of a junior college. The purpose of the college was stated in this last enactanent, and was phrased in the following manner:

The State Board of Agriculture is hereby authorized and empowered to provide and establish two years of additional college work, and all such work shall include courses in agriculture, dairying, animal husbandry, soience, mechanical arts, hane economics, educational and other allied and auxiliary subjects. ${ }^{10}$

## Cameron State School of Agriculture

The Cameron State School of Agriculture was one of six secondary agricultural sohools established by act of the legislature in 1907, and its standing was raised to that of a junior oollege in 1924, at the same time the change was made at Connors.

The purposes stated in the legislative actare identioal with those purposes stated for Connors.

Session Laws, Oklahoma, 1923-24, p. 86.

Murray State School of Agriculture
The Murray State School of Agriculture was established in 1907 by the same authority as Cameron and Connors State Agricultural Schools. It was officially elevated to junior college standing in 1924, though some college work was done one yoar previous to that time.

Eastern Oklahoma Colloge
Bastern Oklahoma College was founded in 1909 by the first legislature of the State of Oklahoma as the Oklahana Sohool of Mines and Metallurgy for the purpose of teaching such courses in mining and metallurgy as would give a thorough technical knowledge of all subjects pertaining thereto, including mathematics, chemistry, engineering, ete., included in a four year engineering course and with power to confer degrees in these courses and others that the faculty might deem necessary.

During the World War the institution was closed, but in 1919 it was reopened and functioned chiefly as a trades sohool until 1924. The Eleventh Legislature passed House Bill Number 201, changing the name of the School of Mines and Metallurgy to Bastern Oklahoma College.

The purposes and course of study are defined as follows:
The Eastern Oklahoma College shall have regular courses and such vocational or special courses as may be necessary to conform to the requirements of standard college course, same to be prescribed by the faculty, under the direction of the Board of Regents.

The said Eastern Oklahoma College shall be a separate and independent institution of learning and one of the colleges of the state, but said institution shall include and accentuate in its curriculum

11
Announcement Bulletin, Eastern Oklahoma College, 1936-37, p. 6.
vocational instruction below college grades in voations relating to trades and industries . . . 12

Summary of Purposes of State Junior Colleges
Fron the purposes stated in the acts establishing and renaming the junior colleges of the state, it is seen that the need for rocational and teminal courses has been realized by the state legisLature and that action has been taken to care for these needs. The interpretation of the remedy for these needs, however, is left mainly to the individual colleges, and there still is doubt as to whether the actual needs have been satisfied.

A summary of the purposes of the seven schools has been prepared and is presented in relation to the eleven stated purposes found by Campbell for junior colleges in the nation as a whole.

Table I presents this information in tabular form. The numbers heading the vertical colums represent the eleven purposes from Campbell's study; they are

$$
\text { 1. Preparation for college or university . . . . . . . } 43 \%
$$

2. Give individual attention to students......... 32
3. Econamy of time and money........................... 29
4. Provide smaller classes.............................. 22
5. Contimue home influences............................. 22
6. Provide occupational training..................... 21
7. Provide suitable try-out for college.......... 18
8. Offer completion education........................ 14
9. Develop leadership..................................... 12
10. Further training for High School graduates... 12
11. Meet local needs. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 10

Those columns are checked which represent the sane purposes which are stated in the acts establishing the schools.

It is seen that one of the purposes of all the schools is either

## 12

$$
\text { Ibid., p. } 7 .
$$

to offer occupational training or give completion education. Three of the schools were established for the purpose of preparing for a four year college course; however, all seven institutions offer that type of training at this time.

Gurricula of State Junior Colleges
One means of determining whether the junior colleges are carrying out the purposes which were stated in their establishment is to study the curricula which they are offering. The curricula for these schools have been taken fram their general bulletins for the school year, 1937-38, and are presented in Table II.

A perusal of the table shows that most of the schools offer courses designed to prepare students for further work at senior colleges in ongineering, medicine, agriculture, business, and home economies; this last field, of course, is not offered at Oklahoma Military Academy, a boys' school.

While socretarial work is concicered teminal worls, only one sehool, Usumextaty Preparatory Schoon, offers a thorongh oourse in that ficla. The ammercial department at Pasterm orlahone tolloge has the addition of this course as one of its goale. ghowork, which also is comidered as a terminel ourxiculua is notioeably laoking in this tanle. The adation of this ceparinem was mede et Dastern oklahoa College recently, and a full carriculan of shopwort will be ofrored in 1933-05.

Since noet of the schools reputedly offer "completion edueation," It wonld be expected that their curricula would contain severol surver courses, fiviag the student who has only short tize in which to conglete bis education on oporivity to learn something of several Gielde ad the roldtionshipe exsting betwem these fields of study. friese ponrses, however, were not mentioned.

Continuance of Study
In order to go more deeply into this study of the junior college and the service it is rendering the youth of the state, an analysis of the Eastern Oklahoma College is to follow. It has beon shown that the purposes and curricula of this school are very similar to those of the other junior colleges, and the writer has the feeling that its student body must be a great deal similar to the student bodies of the other junior colleges. This study should give further enlighterment as to the services junior colleges are rendering.

## Chapter III

AN ANALYSIS OF THE STUDENT BODY OF EASTERN OKLAHOMA COLLEGG

The analysis of the students of Eastern Oklahoma. College has been taken up from the standpoint of several groups into which the students may be olassified. These groups include: freshmen, sophomores, high school students, boys, girls, students supported by their parents while attending college, students drawing N. Y. A. funds, students attending school on the Farm Youth Program of the Federal Government, and students attending school by means of House Bill 454, designated in the tables as four-five-four students. These students are either orphans or dopendent children.

The questionnaire was given the students for the following reasons: (1) to learn the vocational interests of the students; (2) to learn whether or not the student was talcing work in preparation for the vocation specified; (3) to leam by a study of the student's hame enviroment whether he will be able to pursue training for his chosen vocation through a four year college course; (4) to determine from the information gained, the curricular needs of the students.

The Detroit Advanced Intelligence Test was given the same group of students who filled out the questionnaire, in an effort to determine the student's ability, and ultimately, whether or not a wise vocational choice was made.

The questionnaire and intelligence test were administered to about two hundred and twenty-five students, only about sixty percent of the total enrollment. Since many of the student comuted from nearby towns and villages, same worked in the city of Wilburton, and a number had
dropped out of school, it was not possible to exemine the entire group. It was felt, however, that the students examined were representative of the group as a whole, as was pointed out in Chapter II, and probably were very similar to a cross section of students from any of the state-supported junior colleges.

In the beginning of the survey it was desired to know the relative number of students in each of the groups, thus giving a basis for later comparisons which often are expressed in percents.

Table I, based upon the two hundred and twenty-four questionnaires returned, shows the number and percent of students in each category. It is seen that the ratio of freshmen to sophomores is better than two to one, a fact which might indicate a growing enrollment, and indeed, the enrollment for the past year was double that of the previous year. The largest group of students is the four-fivefour group which has twice the number found in the smallest group, the Farm Youth Students.

Table I
DISTRIBUTION OF STUDENTS BY GROUPS

| Group | Mumber | Percent of Total |
| :--- | :---: | :---: |
| Boys | 116 |  |
| Girls | 108 | 51.8 |
| Freshmen | 133 | 48.3 |
| Sophomores | 63 | 59.3 |
| High School | 28 | 28.1 |
| Pay Students | 62 | 12.6 |
| N. Y. A. | 45 | 27.5 |
| Farm Youth | 36 | 20.1 |
| 454 Students | 81 | 16.0 |
|  |  | 36.4 |

Vocational Preparation of Students
Before going further, it was desired to know the number in each group desiring a certain vocation, and whether they were preparing themselves for entrance into that vocation. Table II gives this information aecording to olasses as well as by the other groups named. Of the sophomores, fifty-eight, or ninety-three percent indicated preference for some vocation, fifty-seven professed to be taking training for that vocation, and fifty-nine wished to continue work at a four year college. In a later table will be shown that a large percent of this group checked teaching as a choice, and none of the state-supported junior colleges offer education courses; other vocations are listed by each of the groups, many of which have no beginning courses in the Eastern Oklahoma College curriculum. The high school students in many cases were doubtful about what their first choices would be, and in no case did they indicate they were taking training directly for one field of work.

Table II
IUMBER PREPARING FOR SPECIFIC VOCATIONS

|  | Have chosen a <br> vocation | Taking training <br> for that vocation | Plan to attend <br> senior college |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | ---: |
| Group | Boys | Girls | Boys | Girls | Boys | Girls |

Bighty-four percen $\ddagger$ of the four-five-four students, eighty-five percent of the $\mathbb{N} . Y_{0}$ A., and eighty-nine percent of the Fami Youth, and ei.ghty-nine percent of the pay students specified a desire to enter a certain vocation, and the number taking training for that vocation, and planning to continue in a four year college is about the same. As was pointed out previously, preparation for many of these vocations cannot be had in the state junior colleges, and for that reason data concerning students taking training for ohosen vocations cannot be taken as strictly valid.

Since about eighty-six percent of the students wished to attend a senior college, information was gathered concerning the abilities of their parents to finance two more years of education. Table III lists the number in each group who plan to attend college, the number who will be entirely supported by their parents, the number only partially supported by parents, and the number who must support themselves entirely while completing their college courses. Considering from the table only four of the groups, of the pay students, thirty-seven percent will be supported by their parents during their last two years of college work, fifty percent must work part time, and thirteen percent must entirely support themselves. The N. Y. A. students come next in ability to continue college work; ten percent of them will be supported by parents, sixty-five percent will be partially supported by parents, and twenty-five percent must support themselves. The four-five-four students are next with one percent supported by parents, fifty-one percent will have some help, while forty-eight percent must earn their way. The Farm Youth group is last, with no parent-supported students, forty-seven percent partially supported by parents, while
fifty-three percent must earn their own expenses. For the group as a whole, ten percent will be able to finish college supported by their parents, fifty-five percent must hav o part-time employment, and thirty-four percent must support themselves in full.

Table III
PLANS FOR FURTHER COLLEGS WORK

| Group | Plan to attend senior college | Supported by parents during senior college work | Partially supported by parents during senior college | Entirely <br> support <br> self <br> through <br> Sr . College |
| :---: | :---: | :---: | :---: | :---: |
| Pay students | 49 | 18 | 25 | 6 |
| N. Y. A. | 41 | 4 | 27 | 10 |
| Farm Youth | 34 | 0 | 16 | 18 |
| 454 | 70 | 1 | 36 | 33 |
| Freshmen | 11.8 | 12 | 66 | 40 |
| Sophamores | 56 | 7 | 36 | 13 |
| High school | 18 | 1 | 5 | 12 |
| Total | 192 | 20 | 107 | 65 |

These data bring to attention the fact that provision is not being made for the needs of the students at institutions of college level. A very large percentage of students is pursuing training in vocations which require at least four years of preparation, and under the present set-up it is not possible for them to get this training. Either our curricula should be changed or our students should be persuaded by means of proper guidance to pursue training in vocations which require a shorter training period.

## Vocational Choices

Since such a large percentage expressed interests of continuing work in a senior college, their vocational interests were taken up next. The findings are reported in Table IV, showing the number from each group choosing the various occupations as their life work. It is seen here that the principal occupations chosen were: teaching, commercial work (this includes any vocation which might have as a prerequisite, training in general comeroial subjects), agriculture, and engineering. The other choices were in a wide variety of fields. In sane cases several voations were included under one heading. It is an interesting fact that forty-three percent of the students live in rural communities, many more live in small towns, and yet only ten percent named any phase of agriculture as a chosen vocation. A total of ninety-four, forty-one percent of the total number, wish to enter the teaching profession; of this group twenty-sevenwere boys and sixty seven were girls, a ratio which might pretty nearly hold for teachers all over the state. Commercial vocations, including such occupations as banking, auditing, acoounting, stenography, and clerical work, were chosen by nineteen boys and twenty-nine girls, or twenty-two percent of the total.

Table IV
VOCATIONAL INTERESTS BY CLASSES

|  | Freshmen |  | Sophanores |  | High School |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Vocation | Boys Girls | Boys | Girls | Boys Girls |  |  |
| Teaching | 19 | 38 | 8 | 26 | 0 | 3 |
| Cormercial | 14 | 19 | 3 | 5 | 1 | 3 |
| Agriculture | 17 | 0 | 5 | 0 | 1 | 0 |
| Law | 4 | 0 | 0 | 0 | 0 | 0 |
| Engineering | 8 | 0 | 4 | 0 | 8 | 0 |
| Undecided | 4 | 1 | 3 | 1 | 4 | 1 |
| Murse Tr. | 0 | 1 | 0 | 0 | 0 | 0 |
| Forestry | 2 | 0 | 0 | 0 | 0 | 0 |
| Medicine | 1 | 2 | 0 | 0 | 0 | 0 |
| Home Dem. Agt. | 0 | 1 | 0 | 0 | 0 | 1 |
| Musician | 1 | 0 | 2 | 0 | 0 | 0 |
| Dietitian | 0 | 0 | 0 | 1 | 0 | 0 |
| Geologist | 0 | 0 | 1 | 0 | 0 | 0 |
| Aviator | 0 | 0 | 0 | 0 | 0 | 0 |
| Interior Dec. | 0 | 0 | 0 | 1 | 0 | 0 |
| Woodworker | 0 | 0 | 0 | 0 | 0 | 0 |
| Designer | 0 | 0 | 0 | 0 | 0 | 0 |
| Electrio Work | 0 | 0 | 0 | 0 | 0 | 0 |
| Artist | 0 | 0 | 0 | 0 | 0 | 0 |

Ten percent of the students wished to enter some phase of agriculture while nine percent chose engineering. Eight percent were undecided about a vocation, though a number of them were planning to attend a senior college. The remaining ten percent chose a wide variety of vocations, as shown in the table.

Subject Preferences
Along with the vocational choices of the students, the writer made a study of the subject preferences of the students in high school. This might be used as somewhat of a criteria for understanding the choices made by the students and their abilities to succeed in these choices.

The results of this study are indicated in Table VI, which shows the four groups compared with the subject preferences of the groups. In preparing the questionnaire, two blanks were furnished for subject preferences, and this must be kept in mind when interpreting the table. In almost every case the three subjects, English, mathematics, and history ranked highest for the groups. Comenercial subjects were fourth in every ease except the Farm Youth Group where they were listed as third. A variety of other subjects come later in the table, but were not mentioned with great frequency.

When a comparison is made with Table $V$, it is seen that the two tables are in fairly good agreement, for any of the three subjects mentioned first might be used as teaching fields by those who wish to enter the teaching profession. As in the former case also, comnerce was listed in second place. A limited curriculum in the high schools might partially explain this good agreement. Students from the larger high schools expressed a wider variety of preferences than those coming
fram smaller schools.
Table VI
SUBJECT PREFEREENCES OF GROUPS*

| Subject | Pay Student | N. Y. A. | Farm Youth | 454 |

In studying vocational choices there was the possibility that being in one of the four financial groups would influence the choice of the student. This study was made by considering the number in each group in five of the vocational classifications. Table VIII shows that thirty-five percent of the Pay Students checked teaching as a vocational choice, and twenty-six percent wished to enter some line of commercial work. The group showing the largest percentage having teaching as a choice was the Farm Youth Group with fifty-three percent; commerce was second with fourteen percent. In every case teaching was a first choice and some phase of work having commercial training as preparation was second. These ohoices may be better understood when it is seen that the ourricula of the junior colleges are limited to aoademic subjects, and subjects leading to one of the professions. While education courses are not offered, the general preparatory course taken by many of the students is applicable only to further work in a school of education.

## Table VIII

| Undecided | 5 | 5 | 3 | 1 | 3 | 0 | 3 | 1 |

Abilities of Students
The program of the school and of guidance should inform the individual or assist him in discovering his ability in relationship to that possessed by other people, and also the relationship between his abilities in various types of work. This knowledge of his abilities can then be related to the requirements for various occupations and enable him to make a choice of an occupation in which he has a reason1
able chance for success. When it is seen that many of the students who have chosen these vocations requiring at least average intelligence, or ability, made extremely low scores on the intelligence test given, the question arises as to whether the student should be allowed to enter these fields.

Table IX indicates the test scores for the leading vocational groups. The median score for freshmen in colleges over the country is one hundred and twenty-seven. The "teacher" group shows a median score for boys of one hundred and ten, and the girls scored one hundred and eighteen. The ranges for both boys and girls are very wide, and it would seem that at least half of each group, or those making below the median should be advised to pursue same other course. Since these medians are several points below the median for the country at large, this advice should be justified, and there could be no doubt whatever that the lowest quartile were in the wrong vocation.

The group desiring some phase of commercial work scored much higher on the test, while the range was about the same as in the former case. The lower members of this group, too, must surely be I
G. E. Kefauver, "The Functions of Guidance," The Junior College Currioulum, p. 108.
pursuing the wromg course. The fact that the "emmexcial" group chose Wat theld of work night be meflection of their good judgent, for a shorter training period is regrired, and thas leas expense will be met in preparine thenselves for placement on a job. Even the median score for the grow whe obose angineering seens low, end surely those studerte havinu soores belet the median pould nover succeed in work so tedmical as engincorize. Whether the low scores of the "undecided" gronp are indicative of any one thing is a question, but thoy might infor thet the lese intoligent student is less likely to bo able to maie a decision. The ranges indicated, however, do not bear this out in tuil. The writer is aware of the fact thet these scores cancot be teken too literally, but a rance of sevoral points will indicate at least a differenco in becherown end ooherement, if not a groot Qiparonce in intelligence.

Table IX
TEST SCORES BY VOCAPIOMAL GROUPS

| Vooation | Hodien Scoro |  | $\begin{gathered} \text { Ranges in Scores } \\ \text { Boys Girls } \\ \hline \end{gathered}$ |  |
| :---: | :---: | :---: | :---: | :---: |
| Teschtrg | 110 | 118 | 180-63 | 199-58 |
| Cormerce | 135 | 127 | 191-69 | 181-52 |

| Undecided | 107 | 104 | 164-62 | 193-41 |
| Wational Morn for College Freshmen - - 127 |  |  |  |  |

A possible explanation for the low grades on the intelligence test wes sought by examining the different groups with the idea that a particular group we lavering the median scores unduly. In table $x$
are shom the nedian ages, the median intelligence scores, and the range in soores by groups. The Pari Youth Boys are oldest while the 75. Y. A. Ginls have the groatest agemedian. In nether case does Ghool olessificotion explain the age differonce, for with only one or two oreoptions, the Pam Youth Boys are freshen. In overy inctance Whe median intelligence soore for girls is greater then the soore of the boys, the average difference being fourteen points. the high nadian score for boys is found under the Poy Student Group, while tho bigh for girls is under the Para Youth oroup. fine ranges for every group are great. The low mediaz score for fourmfivefour bors may be partially exiained by the presence of scores for several high school students. As a wole the groups might be said to have about the perne copebilities, though the four-five-four group is sligithy bolor the average.

| High School | 18-6 | 18-6 | 95 | 83 | 156-51 | 158-41 |

Parents' Oceupations and Students' Yocotional Choices
Any effort to understand the students' vocational ohoices would not be complete without a monledge of the Parents' ocoupations. Data conceming the oceupations of perents of the different groups are shown in Table XI.

Forty-two peroent of the pareats listed are famers, eight percent are miners, eight peraent are publio officials (this group includes city, combty, state and federal officials), six percent cone wncer the M. R. A. Unomployrd olassification, and five pereont are railrond employees. In this list there is a noticoable laok of professional men, there being ao lawyers, no onginoers, only two physioisns, and five ministers: The greatest porcent of famers are parents of Farm Youth Students, while the least sumber of parontfamers come under the Pay Studont Classification.

| Saleman | 2 | 0 | 0 | 2 | 4 |

It might be expected that a large number of students would prefer the vocations of their parents; this, however, did not prove to be true. A comparison of the occupations of parents with the vocational choices of the students is given in Table XII. The vertical columns in the table represent the following: (1) Agriculture, (2) Mining, (3) Public Official, (4) Teacher, (5) Comerce, (6) Engineering, (7) Railroad Enployee, (8) W. P. A. - Unemployed. While forty-two percent of the parents are farners, only nine percent of the offspring wished to enter any phase of agriculture. Several explanations might be offered here, but since almost half of the students are from farm homes, and have experienced the hardships which have come about there during the last few years, due to crop failures and low orop prices, this is not so difficult to understond. While mining, holding of public office, and railroad jobs are engaged in by parents, none of the students have chosen these vocations. The fact that so many students have chosen "white-collar" jobs might be attributed to the parents' desires to give their children better than they themselves had. From the table it is seen that there is a low correlation between the parents' jobs and the choices of the students.

Table XII
VOCATIONAL CHOICE OF SIUDENT GROUP COMPARSD WITH PARENTS' OCCUPATIONS

## Home Situations of Students

Since the student is largely a product of enviroment and training, a. better understanding is had if the number in family and the location of his home are known. Table XIII gives a little greater insight into the factors influencing the students. It is showm here that for every group, the percentage of mothers living exceeds the percentage of fathers living; the fact that in many cases the father is not living helps to explain the inability of students to continue work at a four year college without at least a part time job. The four-five-four group has the smallest percentage of parents living, as would be expected from the nature of the legislative act which enables them to attend school. The bill was enacted to make it possible for orphan or dependent children to attend school. When it is seen that the average number in family of one group is eight persons and the average
for all the groups is more than seven, ample reason is found again for the student's not being able to continue college work. The fact that forty-three percent live in rural districts, and most of the remainder are from small towns, influences the characteristics and behavior of the students, and both these facts should influence the ourriculum which a school has set-up for training these students.

Table XIII
LOCATION OF HOMES AND SIZE OF FAMILIES

| Live in town | $66 \%$ | $57 \%$ | $43 \%$ | $62 \%$ |
| Live in rural community | $34 \%$ | $43 \%$ | $57 \%$ | $38 \%$ |

Educational Status of Pamilies
In order to get a better idea of what further work might be in store for the student, and the abilities and desires of his parents to see that he gets further education, this study of the education of the other members of the families was made. Table XIV is a sumary of the amount of education of each group. Only those members of the student's family twenty years of age or over were considered; this was done in order to obtain a better check on the later years of education. The table indicates that the Farm Youth Students probably will
have the poorest chance of continuing their college careore, while the pay Students probably mill haye the best opportunty to continue. Considexing the entire nuber, only fitty-four percent of the brothers and gisters ever finished hich school, ninotear poreont fanished junior college, and eight and one-half parceat fintshed sentor college. of this total maber of brothers and sisters who finished high school, ony thind-sever percent ever hiniched a junior college and ninoteen percont finished sentor college.

Since they show pleinly that on eatirely senior college preparatory curicular coes not meet the needs of the students, these data ofer a challenge to Basterm Oflohome Gollege and the other junior colleges of the state.

Table $\operatorname{ITY}$

## Chapter IV

A BRIEF SURVEY OF THE AREA SERVED BY EASTERN OKLAHOMA COLLOCE
AS TO OCCUPATIOVAL CORDITIONS AMD POPLATION

A part of Gapter III was devoted to an analysis of the vocational interests of the students and tho ocoupational pursuits of their parents. The analysis was then carried one step further, into the home cormunities of the students.

In making this study of the intelligence, curriculum, and vocational intorests of the students of Eastern Oklahona College, the Writer folt that a thorough lnowledge of the students ${ }^{\text {a }}$ interests, home situations, and abilities should be hed. The hone situation has alreedy bean studied from the standpoint of parents' occupations, size of families, oducational status of femilies, and the looation of the home in urbaz or rural commities. Now in order to get a more thorough understanding of the enviromental effects upon the student by the conmuity, a brief study of the counties from whick the students cone has been made. This enviroment will not only manifest itself on the ctudent before his coming to college, but in a great majority of cases he will return to that same commity after finishing his college wort.

These effects should be considered, therefore, when the effort is made to enalyze the student's vocational ohoiee, and in determining the suitability of the currieulun to his presont needs and the needs Which will be fielt when he roturns to this original enviroment. Anctiner consideration should be concemed with the possibility of securing amployment at the end of the college course. Unless the stadent is eble to continue school until he hes completed training in
sone profession, his training at a junior college is likely to be of littlo value, for the work offered is too apecialized for a broad, general education and not specialized enough in that it does not propere hita for any partioular job maless he is able to finish a four of five year professional course. Pention was made in a previous chapter of some of the eteps already being taron at Eastern oklahoma College to remedy this situation.

Counties to be Consicered
Since the student body is made up of students from thirty-three counties and four states, it is not possible to disouss each seotion separately. However the countios fram which the majority of students cone have been studied.

As a basts for further comparisons, the muber and percentage of students from the counties under discussion hevo been dotemined and are shown in Table XV. Letimer Comty, the county in which the college is located, furnished over a trird of the students, and it wes followed by Pittsbure, Leflore, and Haskell counties. In the table, the term "other" in the vertical colums refors to high school and apecial students; this groum inciudes about twenty percent of the totel earollnent. Other counties ropresented are Beclain, Craig, Kay, KcIntosh, Seminole, Chootaw, Justoges, Johnson, Garfield, Coal, Grady, Grent, Wurray, Hogers, Cherokes, Ohnulgee, Tillnan, Bryan, Marshall, Greer, Canadian, Alfalfa, thlse, hayes, and Beaver. Such a large number of conties in the list is mainly the result of House Bill 454, which males it possible for orphans and dependert children to attend school.

Ta.ble XV
HOME COUNTIES OF STUDENTS

| County | No. | Percent of <br> Total | Fresh. | Soph. | Other |
| :--- | ---: | ---: | :---: | :---: | :---: |
| Latimer | 128 | $36 \%$ | 64 | 24 | 40 |
| Pittsburg | 71 | $20 \%$ | 47 | 18 | 12 |
| LeFlore | 56 | $16 \%$ | 33 | 18 | 5 |
| Haskell | 22 | $6 \%$ | 18 | 3 | 1 |
| Pushmataha | 7 | $2 \%$ | 5 | 1 | 1 |
| Hughes | 4 | $1 \%$ | 1 | 3 | 0 |
| MeCurtain | 7 | $2 \%$ | 5 | 2 | 0 |
| Others | 56 | $17 \%$ | 31 | 6 | 19 |

Youth of Counties Not in School
The disoussion for the remainder of this chapter has been centered around the counties of Latimer, LeFlore, Haskell, Pittsburg, Pushmataha, MoCurtain, and Hughes. The first four are studied because they furnish the majority of the students and are adjacent to the college; Pushanataha is considered because it also is an adjacent county and probably will furmish more and more students from year to year. Hughes and MoCurtain counties are included because they probably will furnish more students in the future.

In this area there are several thousand people of high school and college age who are not in school at all, and the facilities of some nearby college should be made available to them. Table XVI shows the number of youths between the ages of fifteen and twenty-four in each of the seven counties. The next column gives the percentage of
guths, ages oigheen to twenty, who are attonding schooi; the avorage for the group is twenty-one ard one-half parbent. This, of couse, nowas thet only ond out of inve youth betweon these age linits is attonding sohool. These facts denonstrate the possibilitios in Etore for Beatem Oklehome College to render service to this large group of potemtial stadents.

Mable XVI
Youris In aever mearey coumties

| Sounty | Numbar, Ages 15 to 24 | Percent, 13 to 20 in sohool |
| :---: | :---: | :---: |
| Latimer | 2242 | 19\% |
| Levlore | 8791 | 10.3\% |
| Haskell | 3313 | $22.8 \%$ |
| Pittaburg | 10270 | 23.6\% |
| Pusharemat | 3057 | 22.2\% |
| Jocurbesm | 7445 | 21.30 |
| Mughes | 6156 | 24.0\% |

Wrban and Pural Population
A reviev of Table IIII shows thet iorty-three percent of the studente" ferilios live on farns, and a large porcent of the rest live in rumal commaties. Statistios for each of the combties showing totel popalations, urban population, rural fara and rural non-iem popuiations, are given in Table XVII. An avoroge of finty-six peroent of the population in these counties is classified by the Burean of Census as rural I
Populetion Eulleting 1930. Oklahoma; Composition and Char. of the Population. Table 14.
farm population, while thirty-four percent live in rural cammities but do not farm. The remaining ten percent make up the urban population of these counties. There is a distinction between urban and rural non-farm populations which was not taken into consideration by the students, which accounts for the ten percent urban population listed in the census report as compared with the fifty-seven percent of students whose homes were purported to have been in towns. The Bureau of Census defines urban population as that population in towns or cities having two thousand five hundred or more inhabitants. However, it is probable that a slightly greater percentage of students are from urban areas than is shown by the averages for the seven counties as calculated fram the table.

## Table XVII

URBAN, RURAL POPULATIONS OF THE SEVEN GOUNTTES ${ }^{2}$

| County | Population | Urban (percent) | (Percent) <br> Rural non-farm | (Percent) <br> Rural Farm |
| :--- | :---: | :---: | :---: | :---: |
| Latimer | 11,184 | 00.0 | $42.6 \%$ | $57.4 \%$ |
| LeFlore | 42,896 | $7.5 \%$ | $37.2 \%$ | $55.3 \%$ |
| Haskell | 16,216 | 00.0 | $26.4 \%$ | $73.6 \%$ |
| Pittsburg | 50,778 | $30.3 \%$ | $31.8 \%$ | $37.9 \%$ |
| Pushmataha | 14,744 | 00.0 | $39.8 \%$ | $60.2 \%$ |
| MaCurtain | 34,759 | $7.3 \%$ | $30.3 \%$ | $62.4 \%$ |
| Hughes | 30,334 | $24.0 \%$ | $25.6 \%$ | $50.4 \%$ |

## Occupational Data For Counties

In an effort to compare the economic status of the students with

[^0]the area as a whole, occupational data were taken from Consus Reports. This information should be valuable in determining the suitability of the curriculum to the later noeds of the students; also it should be helpful in preparing the curriculun to meet the noeds of inoreasing numbers of students who are caming to the college from these sections. Table XVIII indicates that in every county more people are engaged in agriculture than in any other occupation, Latimer having the greatest relative number with seventy-seven percent and Pittsburg at the bottom of the list with sixty-three percent. The average percentage engaged in agriculture is seventy-one. In LeFlore oounty the number engaged in mining is second with about eleven percent of the total personnel; in MoCurtain county manufacturing is second. In every county retail establishments rank second or third. A comparison of this table with Table XI shows the two to be in fairly good agreement.

Table XVIII
3
OCOTATTONAL PEMSOMEL IM COUNTTES

| Latimer Lerlore Eittsburg Push. Easkell MeCur. Hughes |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total | 1,927 | 7.883 | 7,302 | 3,187 | 3,388 | 7,609 | 4,355 |
| Form Personnel | 1,432 | 5.422 | 4,535 | 2,588 | 2,370 | 5,503 | 3,339 |
| Fonurecturec | 35 | 470 | 192 | 338 | 9 | I,363 | 42 |
| Retail | 107 | 392 | 782 | 165 | 157 | 294 | 404 |
| Wholesale | 11 | 47 | 202 | 16 | 7 | 35 | 3 S |
| Ins., Real Estate | 6 | 32 | 58 | 14 | 9 | 21 | 29 |
| Minesmuarries | X | 822 | $x$ | -- | 112 | -- | x |
| Service | 9 | 54 | 102 | 53 | 53 | 66 | 65 |
| Construation | $x$ | 3 | 11 | 18 | x | $\mathbf{x}$ | $\cdots$ |
| Hotels | $x$ | 16 | 105 | 4 | 6 | 20 | $\pi$ |
| Wiscellaneous | 163 | 20 | 507 | 10 | 5 | 24 | 80 |

It was not gossible to obtain statisties for specific vocations, so it has been nocessary to list the zersomel in large general groups. The sizes of the payrolls for these different groups were investigated and the results are shom in Table XIX.

The totals show in the table do not include farm products, and The writar was unable to secure data on farming for Mocurtain and Tughes counties. With one exception the value of fam products erceeded the others in value of outgut; the only exception is in Leslcro ounty where mining was the largest industry. In Leflore

```
3
Ocoupetional Statisties, Oklahoma, 1930, Bureau of Consus.
```

and Mchurtain counties occurs the most manufacturing; the lumber industry causes the Mocurtain payroll to be unusually high.

The ranks of these counties are well distributed, and the area as a whole might be fairly representative of the entire state.

## Table XIX

PAYROLL IN INDUSTRY AND BUSINESS
(Exprossed in thousends of dollars)

## Chapter V

## CONCLUSIONS AND RECOMMSNDATIONS

This study has been an attempt to analyze the purposes and curricula of all the junior colleges of Oklahoma, and to find their relation to the Eastern Oklahoma College, its student body, and the area served by it. A few of the most plainly evident facts of the study are listed here with some of their implications.

It was found from the purposes stated in legislative acts that all of the junior colleges of the state were established for one of three purposes: to do preparatory work for four year oolleges, to give vocational work, or to offer terminal work. Nothing was mentioned of the needs of the area served by these schools.

It was found from an examination of the general catalogues of these schools that most of the work offered was of the preparatory type, with few of the courses actually designed to meet the needs of terminal students.

The questiomaire revealed that of the students of Easterm

- Oklahoma College, eighty-six percent wished to attend a senior college, while only ten percent of the group would be able to attend school by means of parent support. of the remaining group, fiftyfive percent would partially have to support themselves while in attendance at a senior college, and thirty-four percent would have to support themselves entirely. These facts indicate the great need for guidance.

The vocational choices on the questionnaires indicated that forty-one percent of the entire number wished to enter the teaching profession while twenty-one percent desired to enter some phase of
business. Intelligence scores for the groups indicated that many of the students who desired to enter professions which require a maximum of ability, probably would never be able to succeed in the field which they had chosen. Here again is manifested the need for vocational and educational 'guidance.

There was found to be little correlation between the occupations of parents and the vocational choices of the students. This was explained previously by the fact that most of the students came from rural commoities and farm homes, and their choices had been affected by the attractiveness of some of the higher professions.

The futility of many of the students entering training which requires four to five years for completion was emphasized by the fact that the average number in family was seven persons. A college education is hardly possible for a large family on the incone of the average farmer.

Of the members of the students' families who were twenty years of age or older, it was found that only fifty-three percent ever finished high sohool, and only nineteen and one-half percent ever finished junior college. This indicates the need for better facilities for youthe of high school and junior oollege age.

From statistics obtained from the Bureau of Census it was found that only twenty-one percent of the youth, ages eighteen to twenty, were in school. Here is mphasized the great possibilities which are in store for Bastern Oklahama College and upon which the college administration is working at the present time. Every offort is being made to make available greater facilities to the youth of this area.

Of the seven counties surrounding Eastern Oklahoma College, fifty-six
percent of the people are engaged in agriculture. This is in fairly good arroement with the number of fam homes represented in the student body at the college. Over the area as a wole, faxming is the chief occupetion and retail establishments, manufacturing (rainly lumboring). and mining cone next in the order mentioned. The occupations having the largest total payrolls are, in descending order, faming, retailing, manufacturing, wholesaline, and mining. This information should be used in an efrort to build a currioulun to neet the needs of this territory.

Since the counties rank in total manufacturing output fron sixteen to sixty in the state, it was folt by the writer that the sewen countios discussed in Chapter IV of this study would represent fairly well a cross-section of the state as a whole. If this be true, the value of the strudy has been onhanced.

## RECOMSMDATIOMS

Since this strady has revoeled that a najority of the students are anticipating a four year college course, and since investigation has show that only a very small percentage will be able to take this senior college work by means of parent support, it might be concludad here that some steps should be taken to guide these stadents into a vocacion with a shorter training period. It is the writer's contention that this can be done only through a well organized guidance organization made up by the faculty of the college with one faculty nember responsible for the administration and organization of this program.

Results of intelligence scores further emphasize this need for
guidance. Whan of the students made extremely low scores on the tests, while on tho questionaire they indicated preference for such profesm sions as engineoring, law, and teaching Certainly an officiont guidance program woula be a valuable tize sever for these stadents, for it is a certainty that thoy could never succeed in these fialds of work.

Although a great majority of the students desire to attend a seaior eollege, there is little likelihood thet they will ever be able to do so, and a suitable ourriculum showld take into consideram tion this fact. A terminal eurriculua offoring broad survey courses soems to be the only axswer to this problon. A student should, during his junior college years, study those subjects which will jetter onable him to understand the complex problens of the day, and wioh furcher will give hin the ability to read current literature with an understgaing point of view. The writer realizes that such a curriculum is a dractie departure from the traditional type wich is in operation at the present time, but it is his beljer that this move is in the of cing.

This study hes, of course, been limited in seope, but it is the writer's belief that the rindings whion have been presented nay be . typical not only of the junior colleges of oklahome, but also of juaior colleges over the nation. Only further research will deteraine the answer.
